

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

# DEDUCTIVE LOGIC.

*FOWLER.*

from seeing and smelling it. All these perceptions I can recall to-morrow, even though the rose be absent, by the act or operation of imagination. Lastly, I may compare this particular rose with another which lies on the table, or with one which I saw yesterday, and I may express their similarity by calling them both moss-roses, or their difference by calling one a moss-rose and the other a Tudor rose. Again, moss-rose and Tudor rose, which names are both results of the act or operation of comparison, may themselves be compared, and their points of similarity expressed by the word 'rose.' So rose and dahlia may be compared, and their points of similarity expressed by the word 'flower.' Or I may compare the feeling with which I contemplate the rose with similar feelings which I have previously experienced, and call it 'pleasure;' or I may compare it with the feeling which I experience when I prick my finger with a thorn, and call one 'pleasure,' the other 'pain;' or I may compare pleasure and pain themselves, and call them both 'feelings.' The act of making comparisons, and of apprehending similarities and differences, is usually called Thought or Thinking, and the results at which it arrives Thought or Thoughts. The act or operation itself, as distinguished from other mental acts or operations, and the results which ensue from its correct or incorrect exercise, are alike legitimate subjects of investigation for the psychologist or mental philosopher. But the more detailed consideration of the latter, i.e. Thoughts or the results of Thinking, becomes the subject

of a science with a distinct name, Logic, which is thus a subordinate branch of the wider science, Psychology.

---

*Note 1.*—The term Perception is here used in its ordinary sense. The distinctions between External and Internal Perception, Perception Proper and Sensation Proper, are foreign to the present subject. They are discussed at great length in the works of Sir William Hamilton and Mr. Mansel, as well as in those of the Scottish school of metaphysicians generally, but, as involving some of the most abstruse and disputed questions in Psychology, it is not necessary or desirable that the student should acquaint himself with them till he commences the special study of that science.

*Note 2.*—Imagination, as here defined, is what may be called Simple, or Reproductive, as distinguished from what may be called Complex, or Productive Imagination. The former simply represents to the mind absent objects of perception as they were formerly perceived, the latter *combines* phenomena or portions of phenomena, whether absent or present, into a new whole. Thus the notions of a particular man or a particular horse, if the man and horse be absent, are products of simple or reproductive imagination; the notion of a centaur would be a product of complex or productive imagination. For further information on this distinction, see Sir W. Hamilton's *Lectures on Metaphysics*, Lect. xxxiii. The creations of

184

## P R E F A C E.

THE precise object of the following pages is (without pre-supposing any technical acquaintance with logical terminology) to enable a student of average intelligence to acquire for himself an elementary knowledge of the main problems, principles, and rules of Deductive Logic. They are not designed to save him the trouble of afterwards consulting more advanced text-books, either in his own or other languages. The English student who wishes to gain an exact and detailed knowledge of the relations of Deduction to Induction, and consequently of the true place and value of the former process in any special science, must still have recourse to the works of Mr. Mill ; or, if he wish to trace the history of logical terms and doctrines (one of the most important chapters in the history of both ancient and modern literature), he must still consult Sir W. Hamilton's *Lectures*, and

the Appendices and Notes of Mr. Mansel to Aldrich's *Logic*.

To these works, as well as to Archbishop Whately's luminous *Chapter on Fallacies*, and to the original and suggestive work of Mr. James Mill on the *Analysis of the Phenomena of the Human Mind*, the Author must, once for all, express his obligations. He has, however, endeavoured, on all disputed points, to reason out his own conclusions, feeling assured that no manual, however elementary, can be of real service to the student, unless it express what may be called the "reasoned opinions" of its author.

The great difficulty to be encountered by any writer of an English Manual of Logic is the unsettled state of our logical terminology. Many words have various significations, or are used in different senses by different writers, and often there are no recognized terms to express some distinction which it is still incumbent on the logician to notice. A fixed and sufficient terminology can, however, only be created by the habit of teaching Logic, and of carrying on our discussions on the science, in our own Language. But though, in some respects, the Latin terminology may be superior to our own, there

habitually think must be the fittest medium for analysing their thoughts.

The Notes appended to the Chapters (as distinguished from the foot-notes) are designed to inform the student of any divergences from the ordinary mode of treatment, or to suggest to him further reading on topics which, if noticed at all, are only alluded to in the text. They may be omitted on the first reading.

Besides the Notes appended to the various Chapters, it is perhaps desirable that the student, if he is entirely unacquainted with logical and psychological discussions, should omit, on the first reading, the Chapters on the Relation of Logic to Psychology, on the various kinds of Terms, on the Denotation and Connotation of Terms, on the Relation of the Predicate to the Subject of a Proposition, on Verbal and Real Propositions, on Definitions, and on Divisions and Classifications. Unfortunately, the most difficult problems which the logician has to solve occur at the outset of his task.

It is hoped that, independently of its bearing on University Studies, a short English Manual of Logic may be used with advantage in the Upper Forms of Schools,

and that it may not be without interest to the general reader.

With reference to the present system of Examinations in Oxford, this little book is designed mainly for the use of candidates for Honours in Moderations. To gain the requisite information on the Aristotelian Logic, they should add to it a knowledge of Trendelenburg's *Elements*, as well as of Appendices A, B, C, D, F, G, H to Mr. Mansel's Edition of *Aldrich*. A new selection from the *Organon* of Aristotle, preceded by an explanation of his terminology and a brief résumé of the history of ancient and scholastic Logic, would be a most valuable addition to the text-books which are at present in use.

For the Ordinary Examination in Moderations, this work, omitting the appended Notes, as well as the first Chapter of the Introduction and (with the exception of the Definitions at the end) the unavoidably tedious Chapter on the Relation of the Predicate to the Subject of a Proposition, will probably be found to be amply sufficient<sup>1</sup>. It is to be remembered, however, that

<sup>1</sup> Even this modicum exceeds the present requirements. If, however, the student were allowed to avail himself of an English text-book divested of metaphysical language, he might fairly be expected to bring up more matter.

there are some students who can never safely dispense with oral instruction.

The Manuals of Sanderson, Wallis, Aldrich, &c., owing to the peculiar circumstances of the period in which they were written (a period which, being transitional, retained not only much of the scholastic terminology, but also much of the Realistic doctrine), have ceased to be adapted to modern instruction. The author, with some misgivings, and a keen sense of the difficulties of the task, trusts that the present work may be found usefully to occupy their place. Its propositions cannot, however, be presented in the same curt and dogmatic shape, for we have learnt to regard many portions of Logic, like many portions of the sciences whose method it claims to analyse, as fairly open to differences of opinion.

\* \* \* In the Table of Contents it will be observed that the words Definitions, Divisions, Classifications, Inferences, Oppositions, Conversions, Permutations occur in place of the more ordinary forms Definition, Division, Classification, &c. The object of this change is to suggest to the student the importance of distinguishing the *results* from the *processes* by which they are gained.

10 *DIVISION OF THE PRODUCTS OF THOUGHT.*

No rectilineal figure is contained by less than three lines ;

Therefore, no figure contained by less than three lines is a rectilineal figure.

All Englishmen are of mixed descent,

This is an Englishman ;

Therefore, he is of mixed descent.

The last proposition (which is called the *conclusion*) is said to be *inferred* from the proposition or propositions which precede it (called the *premiss* or *premises*).

ELEMENTS  
OF  
DEDUCTIVE LOGIC.

are results of thought, is obvious. But it may not be so easy to perceive that this is the case with singular and collective terms. These terms however are appropriated to individual objects or groups of objects, in order to distinguish them from others, and the necessity for such distinction can only arise after a comparison of this or that individual or group with others, and a perception of certain points of resemblance and difference between them. Unless I had observed some difference between John and Thomas, this table and that, the thirteenth legion and the fourteenth, it would never have occurred to me to distinguish them by separate names; but this very observation of a difference involves an act of comparison, and consequently an act of thought.

*Note 5.*—It is important to notice that in a series of terms, like man, human, humanity, all connoting the same attributes, the later and more abstract terms can hardly fail to suggest the earlier and more concrete, and it is so because the earlier terms of the series have been longer formed and are therefore, as a rule, more familiar to us. Thus 'humanity' can hardly fail to suggest to us the word 'human,' from which it is formed, and 'human' will suggest the word 'man,' from the Latin equivalent of which it is also formed, and whose attributes it expresses. Nor can we use the word 'man' without thinking of this or that individual man with whom we are familiar. A common term, in fact, expresses simply an individual object divested of all its peculiar attributes, and regarded

as possessing only those attributes which it has in common with all the other objects which are designated by the same name. But it is indifferent on which object of the group the mind concentrates its attention, and we are all along conscious that the particular object selected is simply representative of the group. And hence it is that a common name simultaneously suggests to the mind a group of individual objects and a bundle of attributes characteristic of that group. For a further discussion of this subject, see Hamilton's *Lectures on Metaphysics*, Lect. xxxv. and xxxvi.; Mansel's *Prolegomena Logica*, ch. i.; and Mill's *Examination of Hamilton*, ch. xvii.

*Note 6.* — Mr. Mill maintains that attributives, when employed as predicates, are really common terms. Thus the propositions 'All triangles are three-sided,' 'All wise men are just,' are regarded by him as only abbreviated modes of saying 'All triangles are three-sided figures,' 'All wise men are just men.' We should allow that the attributive in the predicate, when taken in conjunction with the subject, always suggests a common term which may be substituted for it, as in the syllogism 'All wise men are virtuous, All virtuous men are happy;  $\therefore$  All wise men are happy.' But, though the attributive may always admit of being expressed as a common term, while it continues to be expressed as an attributive there seem to be present to the mind only attributes, whereas, when it becomes a common term, there seems also to be present a group of individuals possessing those attributes.

## CHAPTER II.

### *On the Denotation and Connotation of Terms.*

A TERM is said to *denote* individuals or groups of individuals, to *connote* attributes or groups of attributes.

In the first place, a term may serve to *denote* or point out an individual object or group of individuals. Thus 'Socrates' denotes or points out and distinguishes from all others the individual man Socrates. The expression 'tenth legion' denotes or points out, and distinguishes from all other collections of men, the particular group known as the tenth legion. Similarly, the word 'man' denotes or points out, and distinguishes from all other groups, a certain group of individuals to each member of which and to each member of which only the word 'man' may legitimately be applied. All terms of this kind, therefore, viz. singular, collective, and common terms, are denotative; but terms like human, white, humanity, whiteness, i. e. attributives and abstract terms, are not denotative, except mediately, that is, so far as they suggest the common terms 'human beings,' 'white things.'

In the second place, a term may serve to *connote* attributes or groups of attributes. Thus terms like humanity, human, man, i.e. abstract, attributive, and common terms, are all connotative, that is, they at once suggest or imply attributes. But singular and collective terms like 'Socrates,' 'the tenth legion,' are not connotative, except so far as they suggest common terms. This requires some explanation. A collective term like 'the tenth legion,' 'the House of Commons,' at once suggests the corresponding common term, 'soldiers of the tenth legion,' or 'members of the House of Commons;' and this common term may connote any number of attributes, but, as the attributes are suggested mediately through the common term and not directly by the collective term, the collective term is, strictly speaking, non-connotative. The same is the case with a singular term. A term like 'William' may suggest to me 'man,' 'male,' 'Englishman,' 'one of my friends,' &c., and so may become connotative, but it is in itself rightly regarded as non-connotative, inasmuch as it suggests to me these attributes only through the medium of the common terms to which it is referred.

It appears therefore that common terms are both denotative and connotative; that singular and collective terms are denotative, but not connotative; that abstract terms and attributives are connotative, but not denotative; and finally, that mediately, as suggesting common terms, any non-connotative term may become connotative and any non-denotative term denotative.

*Note.*—The distinction between the denotation and connotation of a term is often otherwise expressed, as that between the extension and intension (or comprehension), or the extensive and intensive (or comprehensive) capacity, of a notion. Having adopted the phraseology which designates the simplest product of thought as a term, instead of a notion, we shall speak of the extensive and intensive (or comprehensive) capacity of a term. The extensive capacity of a term is measured by the number of individuals which it designates (denotes), the intensive or comprehensive capacity of a term by the number of attributes which it includes or suggests (connotes). It is plain that in a series of common terms, standing to one another in a relation of subordination, the denotation and connotation, or the extensive and intensive capacities, of the term are so related, that as the one increases the other decreases, and vice versâ. Thus, if we arrange in order any series of common terms, as flower, rose, moss-rose, we see that 'flower,' which implies the smallest number of attributes, is applicable to the largest number of individuals; 'moss-rose,' which is applicable to the smallest number of individuals, implies the largest number of attributes: and generally in any series of common terms arranged in subordination, the larger the denotation or extensive capacity, the smaller is the connotation or intensive capacity, and vice versâ. In conformity with this principle, the singular term which stands for the individual and is smallest in denotation, is, when we refer it to

## 22 *DENOTATION AND CONNOTATION OF TERMS.*

the various common terms which may be predicated of it, and so assign to it mediately an intensive capacity, the largest in connotation. Thus the term Socrates, when I regard it as expressing one who was a philosopher, a teacher, a martyr, a soldier, an Athenian citizen, &c., &c., suggests to me far more attributes than any one of these common terms singly.

## PART II.—THE PROPOSITION.

### CHAPTER I.

#### *On the Subject and Predicate.*

A PROPOSITION, as the result of comparison, asserts or denies some word or combination of words of some other word or combination of words, as e. g. 'James is the man I saw yesterday;' 'No rectilineal figure is contained by less than three lines;' 'Some stars are not planets.' As before stated, the words or combinations of words thus employed are called *terms*, the term affirmed or denied is called the *predicate*, the term of which it is affirmed or denied the *subject*, the connecting verb, whether qualified or not by the negative particle, the *copula*, and the predicate is said to be *predicated* of the subject. In the above examples, 'the man I saw yesterday,' 'contained by less than three straight lines,' and 'planets' are *predicates* and are *predicated* respectively of 'James,' 'all rectilineal figures,' and 'some stars' as *subjects*. In the first case the predicate is predicated affirmatively, a fact which is expressed by the copula 'is;' in the two last negatively, a fact which is

expressed by the copula 'is not.' These remarks may appear inconsistent with the form of the second example, but 'no rectilineal figure is &c.' is really an abbreviated and unambiguous mode of stating the longer and ambiguous proposition 'All rectilineal figures are not, &c.'

The word 'predicated,' as equivalent to 'asserted or denied,' is here used in a wider than its ordinary signification. In common language, we say such and such an attribute cannot be predicated of such and such a term, using 'predicated' as equivalent to 'asserted' and as opposed to 'denied.' All ambiguity may be avoided by speaking of the predicate as predicated affirmatively or predicated negatively of the subject.

## CHAPTER II.

### *On the Copula.*

THE Logical Copula, it being its office simply to serve as a sign of predication, is limited to the present tense of the verb 'to be,' with or without the addition of the negative particle, according as the proposition is negative or affirmative. This follows from the fact that it is simply the office of the proposition to express my present judgment as to the compatibility or incompatibility of two terms. Hence all reference to time, past or future, and even to time present, as respects the terms themselves, and not my judgment as to their compatibility, must be expressed in the predicate and not in the copula. I may, for brevity's sake, say 'fire burns,' 'Alexander was the son of Philip,' 'The guns will be fired to-morrow,' and, in practical discussion, it would undoubtedly be pedantic to express these propositions otherwise; but formally, for the purpose of being estimated logically, I must resolve them into their logical elements, and say 'Fire *is* burning,' 'Alexander *is* a person who was son of Philip,' 'The firing of the guns *is* an event which will take place to-morrow.'

Not only does the logical copula convey no notion of

time with reference to the terms themselves (or, to speak more accurately, the things signified by them), but it is also divested of the notion of existence. In other words, it is employed **simply** as a connecting particle, not as a **substantive** verb. Where the substantive verb is used in a logical proposition, it must be expressed in the predicate. Thus 'I am,' 'The king is not,' become 'I *am* existent,' 'The king *is* non-existent.' That the copula implies no notion of existence is evident from the fact that we can use such propositions as these: 'The labours of Hercules are a myth,' 'He is a nonentity.'

Can we modify the copula so as to express certainty, probability, possibility, or other modes of connection between the subject and predicate? This is the celebrated question of Modality, and has given occasion to much dispute amongst logicians. Even though it were granted that the proposition simply expresses our present judgment on the compatibility or incompatibility of two terms, it might be maintained that it should express the nature of our judgment and the degree of our assent or dissent, whether it be certain, approximating to certainty, or faltering. Thus it might be maintained that the following should be accepted as instances of the ultimate analysis of a logical proposition: 'This *is certainly* the man I saw yesterday,' 'This *is probably* the man I saw yesterday,' 'This *is possibly* the man I saw yesterday.' That we use these forms in conversation and discussion is unquestionable, but it is one main object of Logic to analyse our abbreviated inferences and statements

into their full logical equivalents. Instead therefore of admitting various descriptions of copulæ (other than the affirmative and negative), in order to conform Logic to ordinary language, it seems simpler, as well as more scientific, to insist on the uniform character of the copula, and to represent propositions like the foregoing as predicating our degree of assent to or dissent from the sentence in question. Thus, after **asking myself** the question 'Is **this the man** I saw yesterday?', I may either answer simply 'This *is* the man I saw yesterday,' or I may describe the degree of my assent by stating 'That this is the man I saw yesterday *is* certain, probable, possible,' &c. In fact, such propositions seem to be the result of an act of reflection on the degree of our own conviction.

We shall therefore regard the form A *is* or *is not* B as the ultimate and uniform logical analysis of all propositions, though we shall occasionally, for the sake of brevity, avail ourselves of the forms sanctioned by popular language.

## CHAPTER III.

### *Division of Propositions according to their Quantity and Quality.*

WE have already seen that propositions are either *affirmative* or *negative*, according as the copula used is of the form 'is' or 'is not.' This is called a division of propositions according to their *Quality*.

They are further divided, according to their *Quantity*, into *Universal* and *Particular*. For, in affirming or denying a predicate of a subject, it is obvious that I may either affirm or deny the predicate of all the individuals denoted by the subject, or of part only. Thus in affirming mortality of man, I may say 'All men are mortal,' or 'Some men are mortal;' in denying wisdom of man, I may deny it of all men or only of some men, i.e. I may say 'No men are wise,' or 'Some men are not wise.' When the predicate is affirmed or denied of all the individuals denoted by the subject, the proposition is called an Universal Proposition; when of part only, a Particular Proposition. A Singular Proposition, i.e. a proposition of which the subject is a singular term, ranks as an Universal, because the predicate is affirmed or denied of everything (i.e. in this

case, the one thing) denoted by the subject. The same holds good of a proposition in which the subject is a collective term. An attributive, as we have already seen, cannot, by itself, be used as the subject of a proposition. Abstract terms which have come to be used as common terms, and admit of plurals, as figure, triangle, virtue, pleasure, &c., have a denotative power, and may, like common terms, form the subjects of either universal or particular propositions. But those abstract terms, like humanity, wisdom, &c., which retain their original characteristic of being connotative only, and admit of no plurals, simply express an attribute or group of attributes with which, as a whole, it is asserted or denied that the predicate is compatible; consequently, a proposition, of which such a term is the subject, ranks as an universal.

Thus such propositions as 'Ambition is aggressive,' 'Wisdom is a virtue,' 'The fourteenth legion is disbanded,' 'Socrates is an Athenian citizen,' are, on the very face of them, universals. But propositions in which the subject is a common term or an abstract term, used as a common term, must be *quantified*; that is, we must attach to the subject either an universal or a particular designation. It is not sufficient to say, 'triangles are figures,' 'horses are black;' we must state whether we mean that 'all triangles' or 'some triangles' are 'figures,' whether we mean that 'all horses' or 'some horses' are black. 'Indefinite' or 'indesignate' propositions, as they are called, i. e. propositions in which the subject, being

a common term, is not quantified, are inadmissible in Logic.

By combining the division of propositions into universal and particular with that into affirmative and negative we obtain four forms, viz. —

Universal Affirmative.	All X is Y.	(A)
Universal Negative.	No X is Y.	(E)
Particular Affirmative.	Some X is Y.	(I)
Particular Negative.	Some X is not Y.	(O)

We shall in future designate these forms of proposition respectively as A, E, I, O<sup>1</sup>.

---

*Note.* — Sir W. Hamilton, followed by several other logicians, maintains that *in thought* the predicate is always quantified as well as the subject. He proposes to reform the logical theory of the proposition accord-

<sup>1</sup> It sometimes requires a little ingenuity to state a given proposition in one of the above forms. Thus the propositions 'None but the brave deserve the fair,' 'The wise alone are good,' 'Not every historian is worthy of credit,' 'All his acts are not defensible,' when stated in strictly logical form, become respectively, No not-brave (or None who are not brave) are deserving of the fair, No not-wise (or None who are not wise) are good, Some historians *are not* worthy of credit, Some of his acts *are not* defensible. The simplest equivalents of the two former propositions are, All who deserve the fair are brave, All good men are wise, but these are gained by permutation and conversion, two forms of inference which have not yet been explained.

ingly, and in lieu of the four ordinary forms of proposition substitutes the following :—

All X is all Y.

All X is some Y.

Any X is not any Y.

Any X is not some Y.

Some X is all Y.

Some X is some Y.

Some X is not any Y.

Some X is not some Y.

This scheme, if adopted, would, as Sir W. Hamilton shews, reduce all conversion to simple conversion, render nugatory any discussion as to the distribution of terms, and considerably simplify the forms of syllogism : see the Appendices to Sir W. Hamilton's *Discussions*, and to his *Lectures on Logic*. Amongst other criticisms may be seen Mr. Mill's in his *Examination of Hamilton's Philosophy*, ch. xxii. It would of course be undesirable to enter here into any discussion as to the merits of Sir W. Hamilton's theory, but, as reasons for not adopting the quantification of the predicate in the present work, it may be sufficient to state (1) that, as to utility, the trouble entailed by quantifying the predicate in every proposition would probably far exceed that saved by simplifying the forms of Conversion and Syllogism ; (2) that the forms of expression given above are not merely unusual, but are such as we never do use, whereas, though the analysis of our thoughts frequently leads to

/

forms of expression which are unusual, this would be the only case in which it led to which never are used ; (3) that some of the propositions really contain in a compressed form ordinary propositions, as e.g. 'All A is all B' contains the two ordinary propositions 'All A is B' and 'B is A,' the proposition 'Some A is all B' contains two ordinary propositions 'Some A is B' and 'All B is A' whereas it is the object of Logic not to state our thoughts in a condensed form but to analyse them into simplest elements.

## CHAPTER IV.

### *Distribution of Terms.*

A TERM is said to be *distributed*, when it is employed in its entire extent, i. e. when it applies to all the individuals denoted by the name. Thus, when we say, 'all men,' 'no men,' 'man' is distributed; when we say 'some men,' it is undistributed. This phraseology of course applies directly only to common terms, but singular and collective terms, as has already been explained, must always be taken in an universal acceptance, i. e. they are always distributed. The same is true of those abstract terms which have not come to be used as common terms, because they, as it were, personify the attribute or group of attributes which they express; when used in a proposition, they have, in fact, the characteristics of singular terms. In such propositions as, 'This is wisdom,' 'Wisdom is justified of her children,' 'Warmth is essential to growth,' 'Knowledge is power,' there can be no doubt that the abstract terms are distributed precisely as if they were singular terms, and that, for all logical purposes, these propositions rank as universal. Attributives, i. e. adjectives and participles, have no meaning except in connection with a substantive. They must either be prefixed to a sub-

stantive or predicated of it: we cannot say 'human' alone; we must either speak of 'human being,' 'human nature,' &c., or say 'So and so is human.' Consequently the distribution or non-distribution of an attributive follows that of the corresponding common term; 'human,' 'red,' &c., follow the distribution of 'human being,' 'red thing,' &c.

Hence we perceive that a singular, collective, or abstract term is distributed wherever it may occur in a proposition. We have therefore only to enquire as to the distribution of common terms and attributives. With regard to these, the two following rules may be laid down.

1. All universal propositions distribute their subject, whereas particular propositions do not. This is obvious. The very word 'all' or 'no' shews that the subject is distributed, whereas the word 'some' shews that it is undistributed.

2. All negative propositions distribute their predicate, whereas affirmative propositions do not. For in every negative proposition we necessarily exclude from the subject every individual denoted by the predicate, but in an affirmative proposition we do not necessarily include in the subject every individual denoted by the predicate. Thus, if I say, 'No crows are yellow,' 'Some cherries are not red,' I exclude from the group 'crows' every individual object denoted by the term 'yellow things,' and from the group 'some cherries' every individual object denoted by the term 'red things<sup>1</sup>.' But if I say, 'All

<sup>1</sup> Here it will be noticed that the terms 'yellow' and 'red,' though not in themselves denotative, suggest the corresponding common terms 'yellow

men are animals,' or 'Some Englishmen are poets,' I do not include in the group 'man' all animals, nor in the group 'Englishmen' all poets. It may of course happen that the predicate in an A or I proposition is co-extensive with the subject, as in the propositions 'All men are rational animals,' 'Some men are poets,' but this is accidental, and is not implied in the form of the proposition.

From these two rules we infer that, in the case of common terms and attributives, an A proposition distributes its subject only, E both its subject and predicate, I neither, O its predicate only. If a term be singular, collective, or abstract, it is invariably distributed.

things' and 'red things,' and thus, through the medium of the common terms, become denotative.

## CHAPTER V.

### *Relation of the Predicate to the Subject of a Proposition (Heads of Predicables).*

FROM what has already been said, it is plain that a singular, collective, or abstract term, inasmuch as it is always distributed, cannot form the subject of an I or O proposition; on a little reflection it will also be plain that the predicate of a proposition cannot be singular, collective, or abstract, unless the subject be the same. We have already noticed that an attributive can never form the subject of any proposition. These considerations will be found to simplify the problem before us.

This problem may be stated thus: How may the predicates of propositions be classified in relation to their subjects? or What are the heads of predicables (prædicabilia, things or words that may be predicated)? We shall discuss the four forms of proposition in order.

To commence with A, and with the special case where both subject and predicate are common terms, or abstract terms which are used as common terms<sup>1</sup>. Here

<sup>1</sup> It may perhaps assist the student in following what, to be exhaustive, must necessarily be a tedious disquisition, if we afford him some clue to the order in which the cases will be discussed:—

the predicate may either be equivalent in extent to the subject, or greater; it cannot be less. We can say, for instance, 'All men are animals,' or 'All men are rational animals,' but we cannot say 'All animals are men.' Now, if the predicate be equivalent in extent to the subject, it is either a *Synonym* as 'A wold is a down,' or a *Definition* as 'A triangle is a three-sided rectilineal figure,' or a combination of a *genus* (a term which will be immediately explained) with some attribute which is peculiar to the term in question (called by Aristotle an *ἰδιον* or 'peculiarity') as 'A triangle is a rectilineal figure the sum of whose angles is equal to two right angles.' A synonym, it need hardly be stated, is an equivalent word, and a definition is an exposition of the connotation of a term. Now it will be observed that the definition of a triangle consists of two parts, one in which it is designated as 'a rectilineal figure'—a wider group, which includes not only triangles but other rectilineal figures—and the other part an attributive, 'three-sided,' which distinguishes triangles from all other groups contained in the wider group to which triangle has been referred. The former part of the definition is called the *genus*, and with reference to it

In the A proposition, if the predicate be a common term, the subject may be ( $\alpha$ ) a common, ( $\beta$ ) a singular or collective term; if the predicate be a singular or collective term, the subject must be the same. If the predicate be an abstract term, the subject must be the same; and if the predicate be an attributive, the subject may be ( $\alpha$ ) a common, ( $\beta$ ) a singular or collective, ( $\gamma$ ) an abstract term. The discussion of the cases in I, E, and O is much less elaborate

'triangles,' the group of figures defined, is called a *species*; the latter part of the definition, 'three-sided,' which distinguishes triangles from squares, pentagons, and other rectilinear figures which are designated by the wider term, is called the *differentia* or 'differencing' attribute. It is obvious that there might be more than one of these, and then they would be called the *differentiæ*. With reference to the third case, 'A triangle is a rectilinear figure the sum of whose angles is equal to two right angles,' 'rectilinear figure' is, as before, to be regarded as a genus, but the attributive 'having the sum of its angles equal to two right angles' cannot be regarded as a *differentia*, for it is not connoted by the term 'triangle,' but requires to be proved of it; at the same time it is an attribute *peculiar* to the triangle, and hence, retaining the Aristotelian term, we may call it an *ἰδιον*. Lastly, there remains the case in which the predicate is of greater extent than the subject, both being common terms, as in the propositions 'All men are animals,' 'All triangles are figures.' Here the subject denotes a smaller group of individuals included under the wider group designated by the predicate; that is, according to the terminology already explained, the predicate is related to the subject as *genus* to *species*.

When the predicate is a common term, and the subject a singular or collective term, as in the instances 'Socrates is a philosopher,' 'Socrates is an Athenian citizen,' 'The House of Commons is a branch of the legislature,' the predicate is related to the subject as a

group of individuals to an individual, i.e. as a *species* to an individual, for the word 'genus' is only applicable to a group containing other groups. The same account must be given of those propositions in which the predicate is an abstract term employed as a common term, and the subject is an abstract term which does not admit of a plural, as e.g. 'Temperance is a virtue,' 'Heat is a mode of motion.'

When the predicate is a singular or collective term, the subject must, as we have already seen, be a similar term. Moreover the predicate in these propositions is always distributed as well as the subject, and consequently the two terms are co-extensive. But, inasmuch as singular and collective terms have, at least directly, no connotation, the predicate cannot stand to the subject in the relation of a definition, or of an ἰδιον<sup>2</sup> (i.e. a peculiar attribute) combined with a genus. It can only be a synonym, or a singular or collective term designating the individual or the collective group. As instances of these propositions we may give the following: 'Cephas is Peter,' 'Socrates is the son of Sophroniscus,' 'This is the man whom I saw yesterday, and whom I told to come to me,' 'The fourteenth legion is the legion quartered in Britain.' When the predicate is not a synonym, it may perhaps be called a Designation.

When the predicate is an abstract term, the subject must be abstract as well, and, as in the case of singular

<sup>2</sup> There is no English word which exactly corresponds to this expression.

and collective terms, the subject and predicate are both distributed, and consequently are of equal extent. We take as instances of the various forms which propositions of this kind may assume, 'Charity is love,' 'Honesty is the best policy,' 'Definition is the exposition of the connotation of a term.' Now in the first example 'love' is intended as a synonym of 'charity,' in the second 'the best policy' is predicated of 'honesty' as distinguishing it from all other courses of conduct; the third example is an ordinary case of a definition. The case of two abstract terms may therefore be regarded as identical, so far as concerns the relation of the predicate to the subject, with that of two common terms which are co-extensive.

Lastly, there remains the case in which the predicate is an attributive. Supposing the subject to be a common term, the predicate may, as we have seen, be a *differentia*, as in the proposition 'All triangles are three-sided,' or an *ἰδιον*, as in the proposition 'All triangles have the sum of their angles equal to two right angles.' Or, though neither a *differentia* nor an *ἰδιον*, it may be what, along with the *ἰδιον*, modern logicians would call a *Property*, viz. an attribute which, though not connoted by the subject nor even peculiar to it, follows from something connoted by the subject either as effect from cause or as conclusion from premiss. An instance of a property which follows from the connotation of the subject *by demonstration* would be given in the proposition 'A parallelogram has its opposite sides equal' or in the proposition 'A circle is a figure the ratio of whose

circumference to its diameter is approximately 3.14159:1.' As instances of propositions in which the predicate expresses a property following from the connotation of the subject *by causation*, we may give 'Men are capable of combining for purposes of joint action,' 'Water communicates pressure equally in all directions.' The first property follows from rationality, or that combined with the power of articulate speech, which seems to be connoted by the very word 'man;' the second property follows from the fluidity of water. The last example of a property following by way of demonstration and the first of a property following by way of causation are *ἰδία* in the sense of Aristotle, as well as *propria* in the sense of the later logicians. There is one other case, that in which the attributive, though neither connoted by the subject nor following from anything connoted by the subject, is predicable of everything denoted by it. Such an attributive is called an *Inseparable Accident*, and the common instance given by logicians is the proposition 'All crows are black.' If the blackness of crows could be connected by way of causation with any attribute connoted by the name, it would be regarded as a property; if, on the other hand, a crow could be found which was not black, blackness would be degraded to the rank of a Separable Accident, a term which will be explained below.

We have thus far considered attributives as predicates in the special case where the subject is a common term. Where the subject is a singular or collective term, and consequently has no direct connotation, the attributive in

the predicate can only be an inseparable accident<sup>3</sup>. I may indeed say 'Socrates is rational,' but I predicate rationality of him as man, not as Socrates. Where the subject is an abstract term, the attributive in the predicate may be a differentia or a property, but cannot be an inseparable accident, for there are no individuals which the abstract term in the subject denotes.

In the I proposition, we are not concerned with singular, collective, or abstract terms. If the predicate be a common term, it may be related to the common term in the subject either as *species* to genus, or as species to species, as e.g. 'Some men are poets,' or 'Some poets are philosophers.' The latter relation is that of two groups, which have some members in common—overlapping species, as they have been called. The relation may also be that of *genus* to species, as 'Some men are animals,' 'Some poets are men,' but this form of proposition is unnatural, and is practically useless, as it stops at a particular assertion when an universal is legitimate. If the predicate be an attributive, it must, unless the proposition

<sup>3</sup> Sometimes a distinction is drawn between the separable and inseparable accidents of an individual. An inseparable accident of an individual is regarded as one which is predicable of it at all times, a separable accident as predicable only at certain times. Thus in the propositions, 'John is tall,' 'John is sitting down,' 'tall' is regarded as an inseparable, 'sitting down' as a separable accident. But the expressions separable and inseparable accident are here employed in an entirely different sense from that in which they have been employed above, and it seems preferable to regard all attributes which are predicated of individuals, in their individual character, as inseparable accidents—inseparable, that is to say, from the individual under the circumstances in which it is at present placed.

state less than the truth, be a separable accident, i. e. an attribute which is true only of some of the individuals denoted by the subject, as e.g. 'Some men are black,' 'Some triangles are equilateral.'

With regard to negative propositions, it is not necessary to speak at any length. The negation of an attributive in an E proposition implies that it is neither a differentia, property, nor accident; in an O proposition that it is neither a differentia, property, nor inseparable accident, though it may be a separable accident. All that has been said of the relations of singular, collective, and abstract terms, as subjects, either to similar terms or to common terms and attributives, as predicates, in the case of an A proposition, holds good also, *mutatis mutandis*, of similar relations in E. It may perhaps be as well to give a few instances of such propositions: 'Socrates *is not* a poet,' 'Socrates *is not* the man I saw yesterday,' 'The fourteenth legion *is not* engaged in the battle,' 'Charity *is not* obtrusive,' 'Ambition *is not* a virtue.' Where a common term is denied of a singular or collective term, it stands to the subject in the relation of species to individual. Where a common term is denied of a common term, there is nothing to prevent the terms being most remote from each other and hardly admitting of comparison; but here the most appropriate relation is—in an E proposition, that of cognate though exclusive species, i. e. of species which having many characteristics in common, and both falling immediately under the same genus, still denote no individuals in common,—in an O proposition, that of

overlapping species. Thus we should be far more likely to derive information from such propositions as these, 'No sandstone is limestone,' 'Some astronomers are not mathematicians,' than from such propositions as these, 'No men are trees,' 'Some stones are not vipers.'

From what has been said we have derived the following names for the predicate in its relation to the subject: synonym, definition, designation, genus, species, differentia, ἰδιον, property (not being an ἰδιον), inseparable accident, separable accident. Of these, logicians have neglected synonym and designation, the former probably on account of its unimportance, the latter perhaps because it applies only to singular and collective terms. Definition is analysed into genus and differentia; no distinction is drawn by later logicians between ἰδια and those properties which are not peculiar to the subject, both being alike designated by the word 'property;' and the word 'accident' serves alike for separable and inseparable accident. Genus, difference, species, property, and accident, are known as the five heads of predicables.

These may be briefly defined as follows:—

A *Genus* is a term expressive of a wider group of individuals including narrower groups.

A *Species*, in reference to a genus, is a term expressive of a narrower group included in the genus; in reference to an individual, of a group including it. Both genus and species are designated by common terms, or by abstract terms which are used as common terms.

A *Differentia* is an attributive which expresses part of the connotation of the subject, and which distinguishes the subject from all other species which fall under the same genus.

A *Property* is an attributive which does not express any part of the connotation of the subject, but which follows from some part of the connotation of the subject, either as an effect from a cause, or as a conclusion from premisses.

An *Accident* is an attributive which may be predicated of the whole or part of the individuals denoted by a common term, or which may be predicated of an individual, but which is neither connoted by the common term nor to be inferred from anything which is connoted thereby.

---

*Note 1.*—Contrary to the practice of most logicians, we have discussed the heads of predicables under the second part of Logic. In doing this, we have attempted to restore to them their original significance in the works of Aristotle, as a classification of the predicates in their relation to the subjects of propositions. It is perhaps needless to add that we have not followed implicitly the Aristotelian account, or in all cases adopted the Aristotelian phraseology. By Porphyry, the schoolmen, and their successors of the seventeenth and eighteenth centuries, the heads of predicables were regarded as a classification of universals in their relations to one another, rather than with reference to their place in a proposition, and consequently, from the time that Logic was divided into

parts, were discussed under the first part. Definition and division, as dependent on a knowledge of genus, species, and differentia, are also here treated under the second part of Logic, though they are ordinarily discussed under the first.

*Note 2.*—On the vexed, and somewhat subtle, question of the Import of Propositions, or, as it is sometimes called, the Theory of Predication, the student may be referred to Hobbes' *Computation or Logic*, ch. iii, Mr. Mill's *Logic*, bk. i. ch. 5, Mr. Mansel's *Prolegomena Logica*, ch. ii, Sir W. Hamilton's *Lectures on Logic*, Lects. viii. and xiii, and Mr. Mill's *Examination of Sir W. Hamilton's Philosophy*, ch. xviii. The view we should adopt may be briefly summarized as follows: wherever the predicate is a singular or collective term, or, though a common or abstract term, a synonym of the subject, the theory of Hobbes, that the predicate is a name of the same things of which the subject is a name, furnishes a sufficient account; in all other cases, Hobbes' theory is true, though insufficient, for, where the predicate is an attributive or an abstract term (not being a synonym), the predicate also asserts or denies certain attributes of the subject, and where it is a common term (not being a synonym), not only are certain attributes asserted or denied of the subject, but the latter is referred to or excluded from the group of individuals denoted by the predicate. From this it will be seen that we do not agree with Mr. Mill in regarding all predication (except when the predicate is a singular or collective term) as a predication merely of attributes.

## CHAPTER VI.

### *On Verbal and Real Propositions.*

AFFIRMATIVE propositions in which the subject is a common or abstract term may be divided into Verbal and Real. A verbal proposition expresses merely the connotation or part of the connotation of the term, a real proposition expresses either solely, or in conjunction with part of the connotation of the term, properties, accidents, or both. Thus a verbal proposition simply states what might be gathered from a due consideration of the name, as 'All men are rational,' 'All triangles are three-sided,' whereas a real proposition imparts knowledge which could not be gathered from the name alone, as 'All triangles have the sum of their angles equal to two right angles,' 'Some men are black.'

---

*Note.*—The distinction between verbal and real propositions is otherwise expressed by that between Analytical and Synthetical judgments (Kant), Explicative and Ampliative judgments (Sir W. Hamilton and Abp. Thomson), Essential and Accidental propositions (the schoolmen). Tautologous propositions (All A is A), and propositions in which the predicate is a synonym of the subject (as e.g. 'Charity is love'), should be referred to the head of verbal propositions.

## CHAPTER VII.

### *On Definition.*

A DEFINITION may always be represented as a proposition, of which the term defined forms the subject<sup>1</sup>. It is its object to expound the connotation or intensive capacity of a term, i.e. to state the attributes which the term implies.

From this it is plain that singular and collective terms, inasmuch as they do not in themselves connote any attributes, are incapable of definition. They may, however, be *described* by means of the various common terms which are predicable of them, as well as by designations which are peculiar to themselves. Thus I may say 'John is a tall man of fair complexion, is by profession a London solicitor, and occupies such and such a house in Bedford-row.' This may be called a *Description of a Singular or Collective Term*, in order to distinguish it from the Description of a common term, which is noticed below, and which we shall call simply Description. Besides singular and collective terms, a term expressing a single attribute, which is incapable of analysis into other attributes, is incapable of definition. Thus it has been maintained that it is useless to attempt to define such terms as pleasure, pain, colour, thing, attribute, &c.

<sup>1</sup> It is indifferent whether we speak of the entire proposition as the definition, or merely the explication which forms the predicate; similarly in the case of a description.

In defining a term, it would of course be impossible, in every case, to state the definition in terms expressive of attributes which were themselves incapable of analysis, even if we were agreed as to what are terms of this character. The terms employed in the definition may therefore express groups of attributes, provided that, when taken together, they exhaust the connotation of the term defined. Thus each of the words 'rational' and 'animal' expresses a large group of attributes, but if, when taken together, they exhaust the connotation of the word 'man,' the definition may be accepted as legitimate.

In seeking to define a term, I invariably contrast it with some other term; often, when I imagine it to be difficult to exhaust the connotation, with a variety of other terms, from which I seek to distinguish it. Thus in seeking to define 'monarchy,' I contrast it with other forms of government; in seeking to define 'triangle,' I contrast it not only with other rectilinear figures but with spherical triangles; in seeking to define 'light,' I contrast it with heat, sound, electricity, and other impalpable powers of nature. Now that portion of the definition which is common to the term defined and to the other terms with which it has been compared is called the *genus*, the term defined standing to it in the relation of a species, as has already been explained; that portion which distinguishes the term defined from the terms with which it has been compared is called the *differentia*, or sometimes, when there is more than one distinguishing

it would be absurd to suppose that 'rational' and 'animal' exhaust the connotation of 'man,' but the word 'rational' is sufficient roughly to distinguish the human race from the lower animals with which it is generally contrasted. When these *incomplete definitions*, as they are called (i. e. definitions which do not give the complete connotation of a term), are once admitted, it is obvious that our definitions of the same term may vary indefinitely according to the particular point of view from which we make them, or the science which we happen to be pursuing at the time.

An exposition of a term which gives no part of its connotation, but in lieu of it an enumeration of properties and accidents, is called a *Description*. Thus 'Man is a featherless biped<sup>4</sup>' would be regarded as a description, not as a definition of man. But the term 'description' is also extended to those cases in which properties and accidents are combined with a portion of the connotation, the latter being usually stated as the genus. Thus we might describe horse as an animal which is domesticated, which has a mane and a tail, which has a high value attached to it, which is to be found in Arabia and Europe, &c., &c.; or we may take as an instance of a description Cuvier's definition

<sup>4</sup> Here the attributive 'biped,' being used as a quasi-genus (i. e. a property or accident which, for a special purpose, is employed as a genus), is stated in the form of a substantive. This particular example of a description is, of course, absurd, and simply serves the purpose of roughly distinguishing men from birds.

of man, as a mammiferous animal having two hands. The latter instance is sufficient to shew that a description may often serve the purpose of distinguishing the term defined from all other terms, and may therefore be quite adequate to fulfil the purposes of a definition for any special object.

From what has been said it will be seen that definitions may be classified as follows:—

- (1) Complete and final.
- (2) Complete (so far as we know), but provisional.
- (3) Incomplete, but sufficient to distinguish the term defined from all other terms.
- (4) Incomplete, but sufficient to distinguish the term defined for the special purpose in hand.
- (5) A description only, but sufficient to distinguish the term defined from all other terms.
- (6) A description only, but sufficient to distinguish the term defined for the special purpose in hand.

Any pretended definition or description which does not fulfil one of these conditions must be rejected as having no value whatever. In testing a definition, we should at once reject it if it were applicable to any other term, unless we were expressly told that it was used only for the purposes of a particular science, and we found on investigation that it was distinguishable from all other terms employed in that science. Thus, in a discussion on politics, it would be sufficient to define monarchy as the supreme government of one man, but, if speaking generally, I must add 'in a state,' for one man may be

supreme governor in his family, in a school, in a religious association, &c.

---

*Note 1.*—It may have occurred to the student to ask ‘How are we to distinguish those attributes, which form part of the connotation of a term, from the attributes which are inferred from them?’ This is a question which in many individual cases it would be extremely difficult to answer, and there might be great differences of opinion as to what attributes were to be regarded as *differentiæ*, and what as properties. It is in fact the same question as ‘What are the primary, and what are the derived qualities of an object?’. The only general answer that can be given is that, wherever one attribute or quality can be inferred from another, it is to be regarded as a derived quality of the object or a logical property, and that all those attributes that cannot be so derived are to be regarded provisionally as an assemblage of primary qualities or, in logical language, the connotation of the term. As our knowledge advances, it is of course possible that many of these primary qualities may be resolved into secondary, i.e. many of the supposed *differentiæ* may be resolved into properties.

*Note 2.*—The scholastic logicians distinguished between real and nominal definitions, meaning by a real definition the explication of the nature of a thing, by a nominal definition the explication of the meaning of a term. The first would give an answer to such a question as ‘What

man?', the second to such a question as 'What do *we* mean by the term man?' As the meaning we attach to a term exactly corresponds with our knowledge of the primary or underived attributes of the thing, this distinction is now regarded as nugatory. Mr. Mill has however divided the expressions 'real' and 'nominal' definition to mark a distinction, already noticed by Aristotle, between these definitions which define a term expressive of a really existent object and those which define a term to which there is no really existent object corresponding. Thus the definition of a 'horse' would be called a real definition, that of a 'centaur' a nominal definition.

*Note 3.*—Sometimes we may explain a term by a synonym, an etymology, or a translation, which may accidentally be better known to the hearer or reader than the term so explained. These cannot be accepted as definitions in our sense of the word, inasmuch as they do not analyse the connotation of the term; but they would have been regarded as instances of nominal definitions by the older logicians.

## CHAPTER VIII.

### *On Divisions and Classifications.*

A DIVISION may always be represented as a proposition, of which the term divided forms the subject. It is its object to expound the denotation or extensive capacity of a term. This object it effects by enumerating, not the individuals (which would in most cases be impossible), but the smaller groups which the term denotes. The terms denoting these smaller groups are called the *dividing members* (*membra dividenda*) in contra-distinction to the *divided term* (called by the older logicians the 'divided whole,' *totum divisum*).

It is plain that common terms, or abstract terms which are employed as such, are alone capable of being divided. Abstract terms and attributives have, in themselves, no denotation, while singular and collective terms are incapable of being divided into smaller groups. A collective term may however easily be transformed into a common term, and so rendered capable of being divided; thus 'the fourteenth regiment' may become 'soldiers of the fourteenth regiment,' and in this form may be divided into officers and privates, or other groups. The same remark holds good of abstract terms and attributives.

It may be laid down as a test of a logical division that

the term divided must be predicable of each dividing member. Thus 'figure' is predicable alike of triangle, square, &c., 'man' of white man and black man. In this manner it is distinguished from a *partition* of a physical whole into its parts, as of 'man' into head, arms, legs, &c., or of the 'world' into Europe, Asia, Africa, and America. But this test, though sufficient to distinguish a division from a partition, is not sufficient to distinguish it from two other forms of proposition, which nevertheless we must beware of confounding with it. These are an *enumeration* of individuals, and a *distinction* of an equivocal term according to its various meanings, as e. g. of 'humanity,' according as it means human nature, the human race collectively, the virtue of being humane, or the study of polite letters. In a distinction the same definition is not predicable of each of the terms distinguished, but in a division the same definition is predicable of each dividing member.

In dividing a term into terms expressive of smaller groups (or, as they are frequently called, subject-classes), I invariably try to think of some attribute which is predicable of certain members of the group, but not of others. This attribute suggests what is called the *fundamentum divisionis* or *principle of division* (i. e. some characteristic of the group, which is a source of differences amongst its members). Thus, if asked to divide 'triangles,' it may first occur to me that some triangles have equal sides and others not; in this case the characteristic of a triangle that the lengths of its sides

may be variously related, or, in other words, the relation of the sides, becomes the *fundamentum divisionis*, and I divide triangles into equilateral, isosceles, and scalene. Or it may first occur to me that some triangles are right-angled, and others not; in this case the measure of the angles becomes the *fundamentum divisionis*, and I divide triangles into right-angled, obtuse-angled, and acute-angled. Or, to take one more instance, if asked to divide governments, I may reflect that in some governments the sovereignty is divided, in others it is placed entirely in the hands of one person or order, and I may divide 'governments' accordingly into pure and mixed, proceeding to divide pure governments, according to the number of persons in whose hands the sovereignty is placed, into monarchies, oligarchies, and democracies. Any division in which two or more *fundamenta divisionis* are confounded is called a *cross-division* and is logically inadmissible. Thus a division of triangles into isosceles, scalene, and right-angled, or of governments into monarchies, free governments, and mixed governments, or of men into Frenchmen, Asiatics, the unproductive classes, and barbarians, would be a cross-division. In the last example there is a confusion of no less than four *fundamenta divisionis*.

It is maintained by many logicians, and with justice, that in every legitimate division (or, at least, in every division which we have sufficient reason for knowing to be legitimate), the process by which the division is arrived at, if strictly analysed, may be described as follow-

Taking, for instance, 'triangles,' we reflect, say, that some are equilateral; we then divide triangles into equilateral and those which are not equilateral, and again, still thinking of equality of sides, those which are not equilateral into those which have two sides equal (isosceles), and those which have none (scalene). Similarly, taking 'men,' and thinking of race as our *fundamentum divisionis*, we divide mankind into Aryans and those who are not Aryans, the latter into Semites and those who are not, the latter into Turanians and those who are not, and so on, till our division is complete. This process, when formally drawn out, is called *Division by Dichotomy*, and the rule by which it proceeds is in each division to take two terms which admit no medium between them. Thus such pairs of terms as productive and unproductive, fallible and infallible, white and not white, would answer the purpose.

The divided term stands of course to the dividing members as a genus to species. We can also gather the *differentia* from the *fundamentum divisionis*. Thus, in dividing a term, we virtually define the subject terms. A pure government, for instance, may be defined as a government in which the sovereignty is undivided, and a mixed government as a government in which the sovereignty is divided. In defining also we virtually divide. Thus the definition of man as a rational animal implies a division of animals into men and brutes, and the definition of triangle as a three-sided rectilineal figure implies a division of rectilineal figures into three-

sided and not three-sided (i.e. quadrilaterals and polygons).

The rules for a legitimate division may, in accordance with what has already been said, be stated as follows :

1. Each dividing member must be a common term, or an abstract term which is used as a common term.
2. The divided term must be predicable of each dividing member.
3. The division must be exhaustive, i.e. the dividing members, when taken together, must be equal in extent to the term divided.
4. The division must always be made according to one *fundamentum divisionis* only. The use of more than one will produce a cross-division.

It is not necessary to add the rule that the dividing members must be 'mutually exclusive,' as this is already provided for by Rule 4. This rule however often affords a good test for discovering a cross-division. If I find that two dividing members denote some individuals in common, it shews at once that there must be at least two *fundamenta divisionis*. The student may easily frame for himself examples of illegitimate divisions. If we were absurdly to divide Europeans into Celts, Teutons, Slaves, Frenchmen, Spaniards, the Emperor of Russia, and the President of the United States of America, we should have an example of all the faults incident to a division.

In speaking of division by dichotomy we have already introduced the notion of sub-division. For scientific accuracy, and often even for practical purposes, it may be necessary to sub-divide the dividing members, again to sub-divide the results of this sub-division, and so on. The relation of these various divisions and sub-divisions, one to another, has given rise to several logical terms, and is of sufficient importance in itself to require a brief treatment. It is best to commence with an example, and we select a mathematical one, as being of the simplest kind :—

In a series of divisions and sub-divisions like the foregoing, the term at the head of the series (in this case Figure) is called the *Summum Genus*. The terms at the bottom of the series (equilateral triangles, circles, &c.) are called *Infimæ Species*. The intermediate terms are called *Subaltern Genera*, or *Subaltern Species*, viz. subaltern genera with reference to the terms immediately below them, and subaltern species with reference to the terms immediately above them. Thus triangle would be a subaltern genus with reference to equilateral triangle, a subaltern species with reference to rectilinear figure. Species which fall immediately under the same genus, as e.g. triangle, quadrilateral, and polygon, are called *Cognate*

*Species.* A *Cognate Genus* is any one of the ascending genera under which the species falls. Thus triangle, rectilinear figure, figure, are all genera cognate to equilateral triangle. A differentia which *constitutes*, as is said, an infima species is called a *Specific Difference*, one which constitutes a subaltern species a *Generic Difference*. Thus 'equilateral' is a specific difference, 'three-sided' a generic difference of an equilateral triangle. Or 'three-sided' would be regarded as a specific difference, and 'rectilinear' a generic difference of a triangle. Lastly, a property which is derived from an attribute or attributes connoted by a summum or subaltern genus is called a *Generic Property*; a property derived from an attribute or attributes connoted by an infima species is called a *Specific Property*. It is, for instance, a property of all rectilinear figures that the sum of their angles is equal to twice as many right angles as the figure has sides, *minus* four right angles. Thus the angles of a triangle are together equal to two right angles, those of a quadrilateral to four, those of a pentagon to six, and so on. It is also a property of a triangle that it may be generated by the section of a cone, but this is not a property common to other rectilinear figures. Hence the latter would be called a specific, the former a generic property.

The instance we have given is one of the simplest that could be selected. If we had taken instead of it, say, the division of animals into vertebrate and invertebrate, of vertebrate animals into birds, reptiles, fishes, amphibia, and mammals, of mammals into the various species of men,

horses, oxen, &c., it would have required a long scientific discussion to distinguish the various species and genera, to state the specific and generic differences, and to give instances of specific and generic properties. And yet it is exactly in such a case as this that divisions and sub-divisions (or, in one word, Classifications) are most important. In fact, the sciences of Botany and Zoology (in the vulgar acceptation of these words) consist entirely of classifications. To give rules for so important and complicated a process as scientific classification, or even to attempt any precise definition of the word, would be to go beyond the scope of an elementary work like this. It may be sufficient to suggest that where, as in the case of plants and animals, species are separated from one another by an indefinite number of attributes, and may be separated by many attributes of which we are yet ignorant, our classifications, like our definitions, should always be regarded as provisional. To this we may add two plain rules, which meet with universal acceptance: first, that our classifications should proceed as gradually as possible; and second, that we should select as principles of division attributes the most fruitful in their consequences, i.e. attributes from which the largest number of important properties can be derived. Thus the natural system of Botany, founded, in its main division, on differences in the seed-vessels of plants, is far more instructive than the Linnæan system, founded on differences in the numbers of the pistils and stamens.

---

*Note.*—We have employed the expressions ‘summa genus’ and ‘infima species,’ as if they were entirely relative to any particular classification. But in the *Isagoge* of Porphyry, and by the Scholastic logicians who, for the most part, adopted his account, both *summa genera* and *infimæ species*, as well as all the *subaltern genera* and *species*, were regarded as unalterably fixed by nature. Thus the ten Categories of Aristotle (Substance, Quantity, Quality, Relation, &c.) were regarded as the *summa genera*, and terms like *man*, *horse*, &c. were regarded as expressing *infimæ species*. Classes like ‘black men,’ ‘Arabian horses,’ &c. would not have been admitted to be *species* at all. We, on the contrary, conceive that there is no limit to our power of making classes; however specialized a group may be, we can almost always think of some attribute, the addition of which will make it more special still.

## PART III.—OF INFERENCES.

### CHAPTER I.

#### *On the various kinds of Inferences.*

THE third and most important part of Logic treats of inferences<sup>1</sup>. Wherever we assert a proposition in consequence of one or more other propositions, or, in other words, wherever we regard one or more propositions as justifying us in asserting a proposition distinct from any it has preceded, the combination of propositions may be regarded as an inference. Thus defined, inferences may be divided into inductive and deductive, and

The word 'inference' is employed in no less than three different senses. It is sometimes used to express the conclusion in conjunction with the premiss or premisses from which it is derived, as when we speak of a syllogism or an induction as an inference, sometimes it is used to express the conclusion alone, sometimes the process by which the conclusion is derived from the premisses, as when we speak of Induction or Deduction as inferences or inferential processes. Except where the meaning is obvious from the context, we shall endeavour to confine the word to the first-named signification. The terms *Induction* and *Deduction* will be appropriated to express *processes* which result, the former in *inductions* or *inductive inferences*, the latter in *deductions* or *deductive inferences*, these being subdivided into *syllogism* and *immediate inferences*.

deductive inferences may be sub-divided into mediate and immediate. We shall attempt to make these distinctions clear by examples.

I mix tartaric acid and carbonate of soda in certain proportions in water, and I observe that the mixture is followed by an effervescence; from this I *infer* that, whenever tartaric acid and carbonate of soda are mixed in water in these proportions, effervescence will follow. I put a poker into the fire, and I observe that after a time it becomes red-hot; from this I *infer* that incandescence can always be produced in iron by a certain degree of heat. I observe five points in the orbit of a planet, and, from my knowledge of mathematics, perceive that they are situated in an ellipse; from this I *infer* that the entire orbit of the planet is elliptical, and that, in all future revolutions of the planet, a similar orbit will be described. Now what in these cases do I mean by the word 'infer'? That the mixture is *followed* by effervescence is a matter of observation; but it is only an inferential process which justifies me in asserting that, inasmuch as it could have been produced by nothing else, the effervescence was *produced* by the mixture, and that, whenever in future I see a similar mixture, I may expect to see it followed by similar results. Two assumptions, it will be seen, underlie this inference; 1st, that everything has a cause, which leads me to assume that the effervescence must have been produced by something or other; 2nd, the belief in the uniformity of nature, which leads me to expect that, whenever similar circumstances are repeated, they will

be followed by similar results. The reasoning therefore in these cases may be represented as follows:—

The mixture of the tartaric acid with the carbonate of soda is *followed* by effervescence. (Original Proposition.)

- ∴ (Owing to the special circumstances of the case and in conformity with the principle that everything must have a cause), the effervescence was *produced* by the mixture.
- ∴ (In conformity with the principle of the uniformity of nature), a similar mixture will always be followed by an effervescence.

We may represent the reasoning in the third example in the same manner:—

We may assert (by virtue of our knowledge of mathematics) that five points which we have observed in the orbit of the planet Mars are situated in the arc of an ellipse. (Original Proposition.)

- ∴ As there are, comparatively speaking, no forces acting upon the planet except the tangential force and the attraction of the sun, we may infer that the fact of the five points observed being in the arc of an ellipse is due to the combined action of these forces.
- ∴ (In conformity with the principle of the uniformity of nature), it may be inferred that all other points in the orbit of the planet are situated in an

ellipse, and that, in all future revolutions, a similar orbit will be described; i. e. the orbit of the planet Mars may be regarded as elliptical.

Now inferences of this kind are called *Inductive*. The instances we have selected are remarkably simple, but they are sufficient to shew that an induction may be defined as an inference in which we argue from particulars to adjacent particulars, or (if we speak of the adjacent particulars collectively) from particulars to universals, in conformity with the laws of universal causation and of the uniformity of nature. As to the circumstances which justify us in asserting that one phenomenon or set of phenomena is the cause or the effect of, or is invariably conjoined with, another (for this is the problem of Induction), the student is referred to such works as those of Mr. Mill and Dr. Whewell. It is sufficient here to distinguish inductive from the deductive inferences which it is our more special business to explain <sup>2</sup>.

<sup>2</sup> An *Analogy* is an imperfect induction, and bears the same relation to an induction which probable arguments bear to ordinary syllogisms. If two objects resemble each other in several important respects, and we argue that any particular attribute which we know to be predicable of the one, and do not know to be either predicable or not predicable of the other, is, on account of the general resemblance of the two objects, also predicable of the other, the argument is called an argument from analogy; and, in the same way, if two objects are dissimilar, we may argue that an attribute which is predicable of the one, is, on account of their dissimilarity, not predicable of the other. Thus, from the similarity between the earth and the moon, we might argue that the latter is inhabited, or, from their dissimilarity, that it is not inhabited. The value of the inference always depends on the ratio of the ascertained resemblances to the ascertained differences

Beginning where induction ended, we may state such a proposition as this : 'All iron when heated to a certain degree, becomes red-hot.' This, if combined with another proposition 'This is a piece of iron,' leads to the conclusion 'This piece of iron, if heated to a certain degree, will become red-hot.' Now it is plain that the conclusion we have just drawn was arrived at in an entirely different manner from those noticed above. Instead of being the conclusion of an inference in which we argue from particulars to adjacent particulars or from particulars

(it being understood that the resemblances which we take into account are none of them derived, as properties, from each other, and so with the differences), providing that our knowledge of the objects is sufficiently large to justify us in drawing any inference at all. For a more detailed analysis of this mode of reasoning, and an estimate of the value to be attached to its conclusions, the student is referred to Mr. Mill's *Logic*, bk. iii. ch. xx, one of the most instructive and important chapters in his work.

It should be noticed that an analogy, as here described, corresponds to the Example of Aristotle, an analogy being, according to his nomenclature, an equality of relations (*ισότης λόγων*). Thus the expression,

The intellect : the soul = the eye : the body,

is an *ἀναλογία*. From this it is argued that any special relation which subsists between the one pair of terms subsists also between the other. (Or, to take a non-Aristotelian instance, which will be more intelligible to beginners :

A colony : the mother-country = a child : a parent.

From this it is argued that the reciprocal rights and duties of a colony and the mother-state are identical with those of a child and a parent.) An argument from analogy, in this sense, it will be seen, is only a special case of the Aristotelian Example, or of analogy, in the sense in which the term is now usually employed.

The Fallacy of False Analogy will be noticed below.

to universals (i. e. from cases which are within the range of our observation to others which are without), it is simply a combination of two propositions into one, being gathered entirely from what has been previously stated in the premisses. Induction has been not inaptly compared to the establishing of a formula, Deduction (for that is the appropriate name of the process which we are now discussing) to the reading it off. Induction leads to truths entirely new, Deduction combines, methodizes, and develops those which we have already gained.

A Syllogism may be called a Mediate Inference, because the two terms of the conclusion are compared in the premisses by means of a third. It is thus opposed to an Immediate Inference, which consists of two propositions only, and in which the inferred proposition is derived from a single proposition without the aid of any other term or proposition, expressed or implied. Both mediate and immediate inferences may be styled deductive as opposed to inductive.

This division may easily be shewn to be exhaustive. In any inference, we argue either to something already implied in the premisses or not; if the latter, the inference is inductive, if the former, deductive. If the deductive inference contain only a single premiss, it is immediate, if it contain two premisses and the conclusion be drawn from these jointly, it is mediate and is called a syllogism. All deductive inferences which apparently contain more premisses than two admit of being analysed into a series of syllogisms.

*Note 1.*—We are here departing from the ordinary scheme of division adopted by logicians. Inferences are generally divided into mediate and immediate, and mediate inferences are subdivided into inductive and deductive. As however we regard inductions as more strongly contrasted with both syllogisms and immediate inferences than either of these classes is with the other, it seems preferable to make inductions one of the main members, rather than one of the subordinate members of the division. Nor is there any reason why an immediate inference should not be regarded as deductive.

It should also be noticed that Sir W. Hamilton would deny the title of inferences to inductions (as they have been here explained), whereas Mr. Mill would deny that either a syllogism or an immediate inference can properly be called an inference. Mr. Mill maintains that all Inference is “from the known to the unknown;” Sir W. Hamilton defines Inference as “the carrying out into the last proposition what was virtually contained in the antecedent judgments.”

*Note 2.*—The Aristotelian induction, in which the conclusion affirms or denies of a group what was in the premisses affirmed or denied of each member of the group severally, is, according to the above method of treatment, obviously regarded as a deductive inference. If I predicate some quality of each member of a group, and thence infer that all members of the group possess this quality, the conclusion is plainly contained in the

premisses, and the inference is a syllogism. It may be represented in the form <sup>3</sup>—

x, y, z are B.

The individuals constituting the group A are x, y, z.

∴ The individuals constituting the group A are B.

Such an inference is altogether different from what we now understand by an induction. On this subject the student may with advantage read Mr. Mill's chapter on "Inductions improperly so called." See Mill's *Logic*, bk. iii. ch. 2. An account of the Aristotelian induction will be found in Appendix G to Mr. Mansel's Edition of *Aldrich*; in Sir W. Hamilton's *Essay on Logic*, and in his *Lectures on Logic*, Lect. xvii. and Appendix vii. These authors, as already noticed in the case of Sir W. Hamilton, regard inductions, in the modern sense of the word, as extra-logical. The advanced student may also consult with advantage Mr. De Morgan's chapter on "Induction," *Formal Logic*, ch. xi.

<sup>3</sup> By Aristotle himself the inductive inference is analysed thus:—

x, y, z are B,

x, y, z are (i. e. constitute) A;

∴ A is B.

The minor premiss, when stated in so peculiar a form, of course admits of simple conversion, and thus assumes the form given in the text.

## CHAPTER II.

### *On Immediate Inferences.*

§ 1. AN Immediate Inference may be formally defined as a combination of two propositions of which one is inferred from the other, the proposition inferred being virtually included in the proposition from which it is inferred. Of Immediate Inferences the most important forms are Oppositions, Conversions, Permutations <sup>1</sup>.

#### § 2. *On Oppositions.*

Two propositions are said to be *opposed* when they have the same subject and predicate, but differ in quantity or quality or both. An Opposition may be defined as an immediate inference in which from the truth or falsity of one proposition we infer either the truth or falsity of another, this proposition having the same subject and predicate as the former, but differing in quantity or quality or both. Thus from the proposition 'That all X is Y is true' we may infer the proposition 'That no X is Y is false,' or 'That some X is Y is true,' or 'That some X is not Y is false.'

<sup>1</sup> It is the more common practice to speak of Opposition, Conversion, and Permutation, but we have adopted the plural number in order to draw attention to the fact that Logic is concerned with the results rather than with the processes by which they are arrived at.

The opposition between

A and E is called a Contrary Opposition.

I and O, a Subcontrary Opposition.

A and I, or E and O, a Subaltern Opposition.

A and O, or E and I, a Contradictory Opposition.

These forms of opposition are exhibited in the annexed scheme :—

If A be true ; E is false, I true, O false.

If A be false ; E is unknown, I unknown, O true.

If E be true ; A is false, I false, O true.

If E be false ; A is unknown, I true, O unknown.

If I be true ; A is unknown, E false, O unknown.

If I be false ; A is false, E true, O true.

If O be true ; A is false, E unknown, I unknown.

If O be false ; A is true, E false, I true.

It will be observed that it is only in a Contradictory Opposition (where the opposed terms differ both in quantity and quality) that from the truth or falsity of one proposition we can invariably infer the truth or falsity of another, the conclusion which we draw in this case being from the truth or falsity of the

one proposition to the falsity or truth respectively of the other. Hence logicians have called contradictory the most perfect form of opposition. It is a rule of practical Logic that a contradictory should always in disputations be used in preference to a contrary opposition; for it serves equally well the purpose of contradicting an opponent, and the particular proposition which it asserts affords less ground for attack than an universal. Thus, if my opponent asserts A (as e.g. All philosophers are unimaginative), I may meet his assertion by the contradictory O (Some philosophers, as e.g. Plato, Goethe, &c., are not unimaginative), and from this position I cannot well be dislodged. But suppose I assert in opposition to him an E proposition (No philosophers are unimaginative), he will probably be able to adduce instances of some philosophers who, according to the ordinary meaning of the word 'imaginative,' would be called unimaginative, and so, by meeting my E with an I proposition, gain an apparent victory. As a fact, we should each have made assertions too wide, but he would have succeeded in dislodging me from my position, whereas (owing to my neglect of the laws of contradiction) I should not have succeeded in dislodging him from his.

---

*Note.*—It is plain that, according to the ordinary meaning of the word 'opposition,' it is somewhat of an abuse of language to speak of A and I, or E and O propositions as being opposed. It would be better

if this form of inference were called Subalternation or Subordination.

Nor, strictly speaking, can the relation between I and O be called one of opposition, for they may both be true together. Accordingly, Aristotle says that in reality (*κατ' ἀλήθειαν*) there are three forms of opposition (those between A and E, A and O, E and O), though in language (*κατὰ τὴν λέξιν*) there are four (adding that between I and O). What is called a Subaltern Opposition he does not recognise.

### § 3. *On Conversions.*

A proposition is said to be *converted* when its terms are transposed, so that the subject becomes the predicate, and the predicate the subject. A Conversion may be defined as an immediate inference in which from one proposition we infer another having the same terms as the original proposition, but their order reversed. This inference in some cases necessitates a change of quantity in passing from one proposition to the other, and then it is called a *Conversion per accidens*; when it necessitates no such change, it is called a *Simple Conversion*<sup>2</sup>.

I and E may both be converted simply. Thus, from 'Some X is Y,' or 'Some poets are philosophers,' I may infer 'Some Y is X,' or 'Some philosophers are poets.' From 'No X is Y,' or 'No savages are trustworthy,' I may infer 'No Y is X,' or 'No trustworthy persons are savages.'

<sup>2</sup> It is proposed by Sir W. Hamilton to call the original proposition the "Convertend," the inferred proposition the "Converse."

A can only be converted *per accidens*. For though it may sometimes happen that the subject and predicate of an A proposition are co-extensive, and therefore convertible, this is not implied in the form of the proposition, and it is with what is implied in the form of the proposition that we are alone concerned. Thus, if I assert the proposition 'All triangles are three-sided rectilineal figures,' it happens in this particular case that I am justified, without any change of quantity, in stating the converse, 'All three-sided rectilineal figures are triangles.' But if I state that 'All triangles are rectilineal figures,' I am only justified in inferring that 'Some rectilineal figures are triangles.' As, therefore, the general form of an A proposition does not imply the simple convertibility of the subject and predicate, I am only justified in inferring from 'All X is Y,' that 'Some Y is X.'

An O proposition cannot be converted at all. From 'Some X is not Y,' it does not follow that 'Some Y is not X,' for Y may stand to X in the relation of a species to a genus. Thus from the proposition 'Some Europeans are not Frenchmen,' I cannot infer that 'Some Frenchmen are not Europeans.'

#### § 4. *On Permutations*<sup>3</sup>.

A Permutation may be defined as an immediate Inference in which from one proposition we infer

<sup>3</sup> The term Permutation is borrowed from Mr. Karslake's *Aids to Logic*. The same inference is sometimes called Infinitation, from the Nomen Infinitum, or, more properly, Nomen Indefinitum (not -Y, as the contradictory of Y), which is employed as the predicate.

another differing in quality, and having, therefore, instead of the original predicate its contradictory. Thus :—

From All X is Y, we may infer that No X is not-Y.

From No X is Y, . . . . All X is not-Y.

From Some X is Y, . . . . Some X is not not-Y.

From Some X is not Y, . . . . Some X is not-Y.

The legitimacy of these inferences is apparent from the fact that contradictory terms (A and not-A) admit of no medium, so that, if I predicate the one affirmatively, I may always predicate the other negatively, and vice versâ.

The O proposition, when permuted from 'Some X is not Y,' into 'Some X is not-Y,' may of course be converted into 'Some not-Y is X.' This combination of permutation and conversion is improperly described by Whately and many previous logicians as a single inference, and styled "Conversion by Contra-Position or Negation."

It may assist the student if we add some further instances of permutations :—

All men are fallible,  $\therefore$  No men are infallible.

No men are infallible,  $\therefore$  All men are fallible.

Some poets are reflective,  $\therefore$  Some poets are not unreflective.

Some poets are not unreflective,  $\therefore$  Some poets are reflective.

All poets are men of genius,  $\therefore$  (by permutation) No poets are not-men-of-genius;  $\therefore$  (by conversion)

No not-men-of-genius ( = None but men of genius) are poets.

*Note.*—We have here employed an expression ‘Contradictory Terms,’ which in most works on Logic is explained in the first part, as included under the doctrine of Opposition of Terms. It seemed, however, desirable to introduce only those distinctions of terms which were likely to be frequently required in the sequel of the work. We may here state that ‘Contradictory Terms,’ such as white and not-white, lawful and un-lawful, are terms which admit of no medium, i. e. terms which are not both predicable of the same thing, and one or other of which must be predicable. ‘Contrary Terms,’ like good and bad, black and white, are terms which are most opposed under the same genus; they are not both predicable of the same thing, but it is not necessary that one or other of them should be predicable.

## CHAPTER III.

### *On Mediate Inference or Syllogism.*

#### § 1. *The Structure of the Syllogism.*

A SYLLOGISM may be defined as a combination of two propositions, necessitating a third in virtue of their mutual connection; or as an inference in which a third proposition is inferred from two others conjointly, the third proposition being virtually contained in the two propositions from which it is inferred. This is obviously a definition of a legitimate syllogism. There may (as will appear below) be apparent syllogisms, which do not fulfil the conditions of this definition. We may give the following as instances of syllogisms:—

- (1) All B is A,  
All C is B;  
∴ All C is A.
- (2) All sovereign powers are invested with  
supreme authority over their subjects,  
All republics are sovereign powers;  
∴ All republics are invested with supreme authority over their subjects.

- (3) No rectilinear figure is bounded by one line,  
 A circle is bounded by one line;  
 ∴ A circle is not a rectilinear figure.

The proposition inferred is called *the Conclusion*, the propositions from which it is inferred *the Premisses*, either of them singly being called *a Premiss*.

As the conclusion is virtually contained in the premisses conjointly, it is plain that the two terms of the conclusion must occur in the premisses, one in either. If both terms occurred in the same premiss, the other premiss would be entirely alien to the conclusion. The remaining term of each premiss must be the same; else there would be nothing in common between the two premisses, and the conclusion could not be said to be inferred from the two conjointly. This third term, with which the two terms of the conclusion may be regarded as compared, is called the *middle term*. The predicate of the conclusion is called the *major term*, and the subject the *minor term*; the premiss, in which the major and middle terms are compared, is called the *major premiss*, and should always be stated first; that in which the minor and middle terms are compared is called the *minor premiss*. Thus in a syllogism, formally stated, there are always three propositions including three terms, the premisses occurring first and the conclusion last. But practically, in reasoning, we frequently state the conclusion first, introducing one or both premisses with such a word as 'for' or 'because,' as stating our reason for the assertion. Thus I may say 'I will not go out to-day, for it is raining,'

or, 'I will not go out to-day for it is raining, and the rain may give me a cold.' When stated in this form, the conclusion is called by the older logicians the *Problema* or *Questio*, being regarded as a question to which the reason or reasons assigned furnish the answer. It will also have occurred to the student that, as a fact, we usually state only one premiss, leaving the other (which may be either the major or minor) to be understood. Thus, instead of stating Syllogism (2) formally, as above, I should in an actual discussion say, 'A republic is invested with supreme authority over its subjects, for every sovereign power is invested with such authority,' or, 'A republic is, &c., for it is a sovereign power,' or briefly, 'A republic (being a sovereign power) is invested,' &c.; or, the premiss coming first, 'Inasmuch as every sovereign power is invested, &c., I maintain a republic to be invested with that authority,' or, 'Inasmuch as a republic is a sovereign power, it is invested with,' &c.<sup>1</sup> Instead of suppressing one of the premisses, I may, for brevity's sake, suppress the conclusion. Thus I may say 'Every sovereign power is invested with supreme authority over its subjects, and a republic is a sovereign power,' leaving it to the hearer or reader to draw the conclusion for himself. The syllogism does not pretend to be the form, or even a form, in which our reasonings are usually stated, but simply one of the ultimate analyses of them.

<sup>1</sup> A syllogism with a suppressed premiss is by Aldrich wrongly identified with the Enthymeme of Aristotle. Such a syllogism was called by the Stoics a *συλλογισμὸς μονολήμματος*.

As every term in the syllogism occurs twice, it should be noticed that, on both occasions, it should be used in the same sense, or, to adopt technical language, every term in the syllogism should be used *univocally*. If we use a term *equivocally*, i. e. in two entirely different senses, or even *analogously*, i. e. in two different senses having some relation to each other, it is plain that, logically speaking, we are using two different terms, and consequently the syllogism will include four terms instead of three. This caution includes the rule usually given by logicians against an *ambiguous middle*. The neglect of it, palpable as it might be supposed to be, is often, especially in a long course of reasoning, very difficult of detection, and is a fertile source of fallacy. We may adduce as very simple instances :—

Humanity is a moral virtue,  
 The study of polite letters is humanity ;  
 ∴ The study of polite letters is a moral virtue.

The church is the aggregate of all Christian people,  
 This particular congregation (or particular building) is the church (meaning at some particular place);  
 ∴ This particular congregation (or particular building) is the aggregate of all Christian people.

In the former case, the term ‘humanity’ has come to be used in such widely different senses, that it may be regarded as used equivocally ; in the latter case, the senses

of the word 'church' are perhaps sufficiently nearly allied to be regarded as analogous. All cases of what are termed 'Verbal Fallacies' may be referred to this head.

---

*Note.* The words 'major,' 'minor,' and 'middle,' as applied to the terms in a syllogism, have been inherited by all subsequent logicians from the nomenclature of Aristotle. He regarded what we shall presently call the First Figure (B is or is not A, C is B,  $\therefore$  C is or is not A) as the perfect type of syllogism, and, amongst other modes, stated it in the form C is in B ( $\tau\acute{o}$   $\Gamma$   $\epsilon\acute{\iota}\sigma\tau\iota\nu$   $\epsilon\nu$   $\alpha\lambda\phi$   $\tau\hat{\eta}$  B), B is or is not in A,  $\therefore$  C is or is not in A. Thus stated, C appears to be the smallest, B the intermediate, and A the largest term in extent. See *Prior Analytics*, bk. i. ch. 4. In negative propositions, however, we have no means of determining the relative extent of the subject and predicate, and consequently Aristotle's nomenclature does not properly apply to negative syllogisms. To affirmative syllogisms in the first figure, whether universal or particular, it applies only in a modified shape, for the propositions, All X is Y, Some X is Y, though they imply that Y cannot be less in logical extent than All X in the one case or than Some X in the other, do not exclude the possibility of the subject and predicate being co-extensive. Hence, however convenient it may be, Aristotle's nomenclature applies only, and that not with strict accuracy, to two forms of syllogism (Barbara and Darii) in the first figure.

§ 2. *On Moods and Figures.*

We now proceed to consider the possible, not the legitimate, forms of syllogism. Here there are two circumstances to be taken into consideration: 1st, that syllogisms may vary according to the quantity and quality of the propositions (A, E, I, O) of which they are composed; 2nd, that they may vary according to the position of the terms in the premisses. It is by combining these two sources of variation that we shall obtain the number of possible syllogisms.

There are, if we take into consideration the conclusion, sixty-four possible combinations of the propositions A, E, I, O, i. e. in technical language, sixty-four possible *moods*, viz. AAA, AAE, AAI, AAO, &c. But if we consider the premisses only, the number of possible moods is limited to sixteen, viz. AA, AE, AI, AO, EA, EE, EI, EO, IA, IE, II, IO, OA, OE, OI, OO. In determining what possible moods are legitimate, we may either ask 'Is this conclusion legitimated by these premisses?' or 'To what conclusion do these premisses lead?' If we ask the former question, we must examine the sixty-four possible moods in which the conclusion appears as well as the premisses; if the latter, an examination of the sixteen possible combinations of premisses is sufficient.

With respect to the possible arrangements of the terms in the premisses (i. e. the *figures*, as they are technically called) there are also two modes of proceeding. Taking

no account of the conclusion (and therefore not knowing which is the major term and which the minor), and asking simply ‘In how many ways can the middle term be combined with the other terms in the premisses?’, there are three possible figures : viz. 1st, that in which the middle term is subject in one premiss and predicate in the other ; 2nd, that in which it is predicate in both premisses ; 3rd, that in which it is subject in both. But if we take account of the conclusion, we are able to distinguish the major and minor terms, and consequently the major and minor premisses. In this case, there are four possible figures, viz. 1st, that in which the middle term is subject in the major premiss and predicate in the minor ; 2nd, that in which it is predicate in both premisses ; 3rd, that in which it is subject in both ; 4th, that in which it is predicate in the major premiss and subject in the minor. These four figures may be exhibited thus :—

Fig. 1.	Fig. 2.	Fig. 3.	Fig. 4.
BA	AB	BA	AB
CB	CB	BC	BC
∴ CA	∴ CA	∴ CA	∴ CA.

If we take no account of the conclusion, either extreme in the premisses may become the major term, and the three figures may be represented thus :—

Fig. 1.	Fig. 2.	Fig. 3.
BA	AB	BA
CB	CB	BC
∴ CA or AC	∴ CA or AC	∴ CA or AC.

§ 3. *Determination of the legitimate Moods of Syllogism.*

*Note.*—Few difficulties in elementary Logic are more likely to embarrass the beginner than the variety of methods of constituting the legitimate Moods of Syllogism. Sir W. Hamilton, as a consequence of quantifying the predicate, is able to represent all syllogisms as equations, and thus to exhibit every affirmative syllogism as a direct application of what is called the Law of Identity (Every A is A), and every Negative Syllogism as a direct application of the Law of Contradiction (No A is not-A). Besides Sir W. Hamilton, other logicians who do not, like him, quantify the predicate, have also attempted to enunciate general principles equally applicable to all syllogisms. See e.g. *Port Royal Logic*, part III. ch. x. Others (as Abp. Thomson, *Laws of Thought*, § 96, and Lambert, as quoted by Mr. Mansel in his *Notes on Aldrich* ch. iii. § 6) enunciate a distinct principle for each figure. Others (and pre-eminently Aristotle) enunciate a canon for the first figure, and test the validity of syllogisms in all other figures by reducing them to the first. Lastly, a favourite method amongst logicians is to enumerate the faults which are incident to a syllogism, and then reject those moods in which they are found. This method is often combined with one or more of the others. Aldrich, for instance, enunciates general canons of syllogisms, then uses the method

we have last explained, and finally reduces syllogisms in the other figures to their corresponding forms in the first.

---

In accordance with the ordinary practice of elementary treatises, and as being perhaps at first more intelligible to the learner, we shall take into consideration the conclusion, and consequently regard the number of figures as four, and that of possible moods as sixty-four, reserving for a note the shorter and more scientific procedure. The problem therefore now before us is to determine which of the sixty-four moods are admissible in each of the four figures.

In the first figure our task is easy. There we are able to establish a canon which will determine directly the legitimate moods.

With a little attention, the student will be able to perceive the truth of the following propositions:—

- ( $\alpha$ ) If one term be affirmed of another, and this of a third, the first term may be affirmed of the third.
- ( $\beta$ ) If one term be denied of another, and this affirmed of a third, the first may be denied of the third.
- ( $\gamma$ ) If one term be affirmed of another, and this denied of a third, we are not justified in drawing any conclusion as to the relation of the first to the third; for, if one term be denied of another, it does not follow that whatever may be predicated of this first term may also be denied of the other. Thus I may deny 'red'

of 'blue,' but it does not follow that 'colour' which I predicate of 'red' may also be denied of 'blue.'

- (δ) If one term be denied of another, and this denied of a third, no conclusion can be drawn as to the relation of the first to the third; for, because I deny one term of another, it does not follow that whatever I can deny of the first can also be denied of the other, nor does it follow that it can be affirmed of it. Thus, because I can deny 'white' of crows, and 'black' of 'white,' (or rather of the corresponding common term 'white things'), it does not follow that I can deny 'black' of crows; nor, because I can deny 'yellow' of 'white' (or 'white things') as well as 'white' of crows, does it follow that I can affirm 'yellow' of crows.

Putting together these results, we obtain the following *canon of reasoning in the first figure*: If one term can be affirmed or denied of another, and this affirmed of a third, the first can be affirmed or denied (respectively) of the third; and, if these conditions are not fulfilled, no conclusion can be drawn<sup>2</sup>. The only moods which fulfil

<sup>2</sup> It is perhaps necessary to point out that the major premiss of a syllogism in the first figure must be universal, else its subject could not serve as the predicate of the minor; for we might be predicating in the minor exactly that part of the term which was not used as the subject of the major, and thus there would be no connection between the premisses.

the conditions of the canon are AAA, EAE, AII, EIO, AAI, and EAO. The conclusions of the two latter might be inferred, by Subaltern Opposition, from those of AAA and EAE, and hence they are called *Subaltern Moods*.

We have obtained, it will be observed, forms of syllogism capable of proving any one of the four propositions, A, E, I, or O, and into one or other of the types accepted as legitimate moods of the first figure all our mediate reasonings may be thrown. Here, then, our enquiry might terminate, if it were simply our object to obtain a sufficient number of legitimate types of reasoning, but the problem before us is to state exhaustively all possible forms which can be accepted as legitimate.

There being no canon which distinguishes with equal precision the legitimate and illegitimate moods of the other figures, we must, in discussing them, have recourse to some other method. We shall first enumerate and explain certain syllogistic rules (derived from the definition of a syllogism) which will exclude illegitimate moods, and then, before accepting the remainder, we shall test them by reducing them to the first figure.

### *Syllogistic Rules.*

I. *The middle term must be distributed at least once.* For, if in both premisses it were used in only a partial signification, it might denote entirely different objects in the one premiss from those which it denoted in the other,

and so there might be no connection between the two premisses. Thus, in the premisses 'All men are animals,' 'All horses are animals,' the part of the group 'animals' which is coincident with 'men' may be, and here is, entirely distinct from that portion of the group which is coincident with 'horses,' and consequently we can draw no conclusion as to the relation between men and horses.

II. *If a term be distributed in the conclusion, it must have been previously distributed in the premisses.* The reason is obvious. If we use a term in a partial signification in the premisses, we cannot legitimately use it in its entire signification in the conclusion. To do so would be to argue from part to whole.

This fallacy is called *illicit process* of the major or minor, according as the term illegitimately distributed in the conclusion is the major or minor term. In the syllogism

Some A is not B,  
All B is C;  
∴ Some C is not A,

we have illicit process of the major; in the syllogism,

All A is B,  
Some C is B;  
∴ All C is A,

illicit process of the minor.

III. *Two negative premisses prove nothing.* For they simply assert that there is no connection between the

middle term and the extremes; consequently we can draw no conclusion with respect to the relation of the extremes.

IV. *If either of the premisses be negative, the conclusion must be negative.* For the other premiss is affirmative, and, if in one premiss we affirm a connection between the middle term and one of the extremes, and in the other premiss deny any connection between the middle term and the other extreme, there can be no connection between the two extremes.

V. *If the conclusion be negative, one of the premisses must be negative.* For we cannot deny that there is any connection between the extremes, except we have previously denied that there is any connection between one of the extremes and the middle term.

VI. *Two particular premisses prove nothing.* For they cannot be both negative (O, O). Nor can they be both affirmative (I, I), for then the middle term would be undistributed. The only remaining case is that of one affirmative and one negative premiss (I, O). But this combination of premisses would leave no term to be distributed in the conclusion. Hence the conclusion would be an I proposition, an affirmative conclusion inferred from a negative premiss.

VII. *If one premiss be particular, the conclusion must be particular.*

1st. Let the particular premiss be I.

As this premiss distributes neither term, the middle term must be distributed (by Rule I) in the other premiss ;

But this premiss (by Rule VI) must also be universal ;

∴ It is either A or E.

(a). Let it be A.

As an A proposition only distributes one term, and that term must in the present case be the middle, no term is left to be distributed in the conclusion ;

∴ The conclusion is I.

(β). Let it be E.

If there be a negative premiss, there must (by Rule IV) be a negative conclusion ;

But, the premises being I, E, only one term is left to be distributed in the conclusion ;

∴ The conclusion is O.

2nd. Let the particular premiss be O.

The other premiss (by Rule III) must be affirmative, and (by Rule VI) universal ;

∴ It is A.

But in the two premisses (A, O) only two terms are distributed, of which one (Rule I) must be the middle ;

∴ One term only is left to be distributed in the conclusion, which, as there is a negative premiss, must be negative ;

∴ The conclusion is O.

The converse of this Rule, viz. that a particular conclusion necessitates a particular premiss, is not true. The only cases however in which we find a particular conclusion without a particular premiss are those in which the premisses assume more than is required in order to prove the conclusion. This will be apparent to the student from an examination of the individual cases, and it might be laid down as a rule that, wherever there is a particular conclusion without a particular premiss, something superfluous is invariably assumed in the premisses<sup>3</sup>.

Of the above Rules, it is plain that Rules III, IV, V, VI, VII are applicable to the moods before they are referred to the several figures, Rules I and II are applicable only when the moods are referred to some particular figure.

By the application of the first set of Rules, the sixty-four possible moods are reduced to twelve, viz.

AAA, AAI, AEE, AEO, AII, AOO,  
EAE, EAO, EIO, IAI, IEO, OAO.

<sup>3</sup> The syllogistic rules are comprised in the mnemonic lines :—

Distribuas medium ; nec quartus terminus adsit.

Utraque nec præmissa negans, nec particularis.

Sectetur partem conclusio deteriore.

Et non distribuatur, nisi cum præmissa, negetve.

Thus EEE is rejected because it has two negative premisses, EAA because it has a negative premiss without a negative conclusion, AAE because it has a negative conclusion without a negative premiss, III because it has two particular premisses, IAA because it has a particular premiss without a particular conclusion.

By the application of rules I and II to these twelve moods, when referred to the several figures, there remain :

in fig. 2, EAE, AEE, EIO, AOO, EAO, AEO ;

in fig. 3, AAI, EAO, IAI, OAO, AII, EIO ;

in fig. 4, AAI, AEE, IAI, EAO, EIO, AEO.

We append a few examples of the method of testing the moods, when referred to the figures.

Take AEE in figure 2.

A	All A is B,
E	No C is B ;
E	∴ No C is A. No fault.

Take IEO in figure 3.

I	Some B is A,
E	No B is C ;
O	∴ Some C is not A.

Illicit process of major.

Take AII in figure 4.

A	All A is B,
I	Some B is C ;
I	∴ Some C is A. Undistributed middle.

It will be seen that of the sixty-four moods, when referred to the four figures, there are only six in each which have not been rejected. It now remains further to test these moods in the second, third, and fourth figures by reducing them to moods in the first.

### *Reduction.*

As we have adopted no canon for the second, third, and fourth figures, we have as yet no positive proof that the six moods remaining in each of those figures are valid; we merely know that they do not offend against any of the syllogistic rules. But, if we can *reduce* them, i. e. bring them back to the first figure, by shewing that they are only different statements of its moods, their validity will be proved beyond question. There are two methods of performing this operation: 1st. that called *Ostensive Reduction*, which consists in employing one or more of the processes of conversion, permutation, and] transposition of premisses; 2nd. that called *Reductio per impossibile*, which consists in shewing, by means of the first figure and the laws of opposition, that the contradictory of the conclusion is false, and therefore the conclusion itself true. Either of these methods is applicable to all the eighteen moods, and the result is that all are proved to be valid. We shall give instances of the application of each method.

By ostensive reduction we shall test E A O in the fourth, I A I in the third, A E E and A O O in the second figures.

Fig. 4.

E	No A is B.	∴ No B is A. (Simple Conversion.)
A	All B is C.	∴ Some C is B. (Conversion per acc.)
O	∴ Some C is not A.	Some C is not A.

Fig. 1.

Fig. 3.

I	Some B is A.		All B is C.
A	All B is C.		∴ Some A is B. (Simple Conversion.)
I	∴ Some C is A.		Some A is C.
			∴ Some C is A. (Simple Conversion.)

Fig. 1.

Fig. 2.

A	All A is B.		∴ No B is C. (Simple Conversion.)
E	No C is B.		All A is B.
E	∴ No C is A.		No A is C.
			∴ No C is A. (Simple Conversion.)

Fig. 1.

Fig. 2.

A	All A is B.	∴ No A is not-B. (Permutation.)
		∴ No not-B is A. (Simple Conversion.)
O	Some C is not B.	∴ Some C is not-B. (Permutation.)
O	∴ Some C is not A.	Some C is not A.

Fig. 1.

The mark  $\times$  shews that the premisses are transposed; the sign  $\therefore$  on the right-hand side of the page is here appropriated to express the employment of conversion or permutation. The last example is interesting, because A O O in fig. 2, and O A O in fig. 3, inasmuch as they contain O premisses, cannot be reduced by the ordinary methods of transposition of premisses and conversion. Hence the older logicians (who, with few exceptions, did not recognise permutation) applied to them the tedious method of *reductio per impossibile* (or, if we write it in full,

reductio per deductionem ad impossibile). This method is equally applicable to all the imperfect moods, as the moods of the three last figures are often called. We now proceed to give an example of it, and shall select AAI in the third figure.

A     All B is A,  
A     All B is C;  
I      $\therefore$  Some C is A.

This conclusion must be true; for, if not, suppose it to be false,

Then its contradictory must be true, i.e.

No C is A.

But (from the premisses) All B is C.     }     Syll. II.

$\therefore$  (By figure 1) No B is A.

But (from the premisses) All B is A.

Now these two (being contrary propositions) cannot both be true.

But the proposition All B is A is assumed to be true.

$\therefore$  The proposition No B is A must be false.

Hence, either the reasoning of Syll. II. is faulty, or one of the premisses is untrue.

But the reasoning (being in the first figure) must be valid.

$\therefore$  One of the premisses is false.

Now the premiss 'All B is C,' being one of the premisses of the original syllogism, is assumed to be true.

∴ The other premiss (No C is A) must be false.

∴ Its contradictory (Some C is A) is true.

*Q. E. D.*

As the positive test of reduction confirms in every case the negative test of the syllogistic rules, we may consider six moods (though not the same six moods) as valid in each figure. These moods may be remembered by means of the mnemonic lines :

*Barbara, Celarent, Darii, Ferioque, prioris :*

*Cesare, Camestres, Festino, Baroko, secundæ :*

*Tertia, Darapti, Disamis, Datisi, Felapton,*

*Bokardo, Ferison, habet : Quarta insuper addit*

*Bramantip, Camenes, Dimaris, Fesapo, Fresison :*

*Quinque Subalterni totidem Generalibus orti,*

*Nomen habent nullum, nec, si bene colligis, usum.*

In the above lines, the initial consonants, B, C, D, F, shew that the mood in the second, third, or fourth figure to which they are prefixed is to be reduced to the mood correspondingly marked in the first. Thus Disamis, when reduced, will become Darii. The vowels shew the moods ; thus Disamis represents IAI in the third figure. The letter *s*, when it occurs after a vowel, shews that the proposition for which that vowel stands is to be converted simply, the letter *p* that it is to be converted *per accidens*. The letter *m* shews that the premisses are to be transposed, *k* that the mood is to be reduced *per impossibile*. It will be noticed that *k* occurs only in two moods, Baroko and Bokardo, but we have shewn that the *per*

*impossibile* method is equally applicable to all imperfect moods, and that these two moods can be reduced ostensibly by means of permutation, so that any imperfect mood may be reduced either ostensibly or *per impossibile*. The initial B in Baroko and Bokardo shews that the *per impossibile* method, in their case, assumes the validity of *Barbara*, but in other cases the operation may assume the validity of some one of the other moods in the first figure; thus, in the particular instance we have taken above, it is performed by means of *Celarent*. It is perhaps needless to add that all letters, not already explained, in the mnemonic lines, are non-significant.

The nature of the *subaltern moods* has already been explained. They are, AAI, EAO in fig. 1, EAO, AEO in fig. 2, and AEO in fig. 4, included respectively in AAA, EAE, EAE, AEE, AEE. They cannot properly be regarded as illegitimate, inasmuch as the conclusions are valid, but they are superfluous, inasmuch as they infer less than is justified by the premisses.

### *The Special Rules.*

Besides the general syllogistic rules, already enunciated and proved, certain Special Rules have been enunciated for each figure. We give them below as generally stated. Those for the first figure have been proved in establishing its canon; those for the other figures the student may verify for himself by applying the rules, already laid down, on the distribution of terms.

Fig. 1. (a) The major premiss must be universal.

( $\beta$ ) The minor premiss must be affirmative.

Fig. 2. (a) The major premiss must be universal.

( $\beta$ ) One or other premiss must be negative.

( $\gamma$ ) The conclusion must be negative.

Fig. 3. (a) The minor premiss must be affirmative.

( $\beta$ ) The conclusion must be particular.

Fig. 4. (a) When the major premiss is affirmative, the  
minor must be universal.

( $\beta$ ) When the minor premiss is affirmative, the  
conclusion must be particular.

( $\gamma$ ) In negative moods the major premiss must  
be universal.

---

*Note.*—If, leaving out of consideration the conclusion, we regard the number of possible figures as three and that of possible moods as sixteen, we may proceed as follows.

Having enunciated the canon of the first figure, we may constitute the moods *Barbara*, *Celarent*, *Darii*, and *Ferio*. The subaltern moods, AAI and EAO, are not admissible, as the question here before us is not ‘What conclusions are legitimated by such and such premisses,’ but ‘To what conclusions do such and such premisses lead?’ Now, from this point of view, the conclusions of the subaltern moods are not directly inferred from

the premisses, but are inferred by subalternation from the universal conclusions to which the premisses directly lead. The same observation will of course apply to the subaltern moods in the other figures.

If we take no account of the conclusion, we have no means of determining which is the major and which is the minor term. Consequently, the premisses may lead to two kinds of conclusions: 1st, those in which the predicate of the first premiss is predicated of the subject of the second; 2nd, those in which the subject of the second premiss is predicated of the predicate of the first. Now the canon of the first figure applies only to the first case; consequently we are bound to ask: any conclusions, falling under the second head, may be inferred from the premisses. These cannot be determined directly, but must be determined in the same manner as conclusions in the second and third figures. Here we proceed by a method similar to that employed in the text. The syllogistic rules exclude seven of the sixteen possible moods, viz. EE, EO, OE, OO, II, IO, OI. When the moods are referred to their several figures we find that, where the extreme employed in the first premiss becomes the predicate, and the extreme employed in the second premiss the subject of the conclusion, the results are, in the second figure, *Cesare*, *Camestres*, *Festino*, *Baroko*; in the third, *Darapti*, *Disamis*, *Datisi*, *Felapton*, *Bokardo*, *Ferison*, the subaltern mood of the second figure EAO, AEO, being inadmissible. Where the extreme employed in the first premiss

becomes the subject, and the extreme employed in the second premiss the predicate of the conclusion, the results are, in the first figure, AAI, AEO, AII, EAE, IEO, which, when we transpose the premisses, become respectively *Bramantip*, *Fesapo*, *Dimaris*, *Camenes*, and *Fresison* in the fourth figure. Hence, according to this mode of treatment, the moods of the fourth figure are regarded as *indirect moods* of the first. Similarly, in the second figure we may constitute the *indirect moods* AEE, EAE, IEO, OAO. These, if we transpose the premisses, are merely a repetition of the ordinary moods of the second figure. This is also the case with the indirect moods of the third figure, viz. AAI, AEO, AII, AOO, IAI, IEO. It will therefore be seen that, with the exception of rejecting the subaltern moods, which even there we regarded as superfluous, we arrive practically at the same results as in the text. The moods of the fourth figure are recognised, but, instead of being regarded as moods of a distinct figure, they are treated as indirect moods of the first. By the expression 'indirect moods,' it will be seen, we mean moods in which the extreme employed in the first premiss becomes the subject, and the extreme employed in the second premiss the predicate of the conclusion.

## CHAPTER IV.

### *On Trains of Reasoning. (The Sorites.)*

SYLLOGISMS may be combined in what is called a *Train of Reasoning*. Thus the major and minor premisses, or either, of our ultimate syllogisms may themselves be proved by syllogisms; the major and minor premisses of these, or either, by other syllogisms, and so on, till at last we come to premisses not admitting of syllogistic proof. Such premisses are either assumed without any proof at all, or they are the result either of direct observation or of the testimony of others or of Induction.

In a train of reasoning, any syllogism proving a premiss of a subsequent syllogism is called with reference to the subsequent syllogism a *Pro-Syllogism*, and the subsequent syllogism with reference to it an *Epi-Syllogism*. It is obvious that the very same syllogism in different relations may be called a Pro-Syllogism or an Epi-Syllogism.

The *Sorites* is a common instance of a train of reasoning in a compressed form. It consists of a series of propositions, the predicate of each becoming the subject of the next. The conclusion predicates the last predicate of the first subject.

Thus,—All A is B,  
           All B is C,  
           All C is D,  
           All D is E;  
       ∴ All A is E.

When expanded, the Sorites contains as many syllogisms as there are propositions intermediate between the first proposition and the conclusion. These syllogisms are in the first figure, and the conclusion of each becomes the minor premiss of the next. Thus, the above Sorites contains three syllogisms, viz. :—

- (1) All B is C,  
       All A is B;  
       ∴ All A is C.
- (2) All C is D,  
       All A is C;  
       ∴ All A is D.
- (3) All D is E,  
       All A is D;  
       ∴ All A is E.

In a Sorites, only one premiss can be particular, viz. the first; and only one negative, viz. the last<sup>1</sup>.

<sup>1</sup> The first premiss, if particular, may be stated in the form 'Some B is A,' instead of in the usual form 'Some A is B;' the first syllogism of the expanded Sorites will then be in the third figure instead of the first. Similarly, the last premiss, if negative, may be stated in the form 'No E is D,' instead of in the form 'No D is E,' which will make the last

For, if there were a particular premiss in any place except the first, there **would** be a particular major, which, in the first figure, is inadmissible.

Again, if any premiss except the last were negative, there would be a negative conclusion in one of the previous syllogisms; this would necessitate, in the following syllogism, a negative minor, which, in the first figure, is inadmissible.

---

*Note.*—Besides the above form of Sorites, there is another called the *Regressive* or *Goclenian* Sorites (so called from Goclenius, who first noticed it). Its properties are exactly the reverse of those of the ordinary Sorites. The subject of each premiss becomes the predicate of the next, the conclusion predicates the first predicate of the last subject, the conclusion of each of the expanded syllogisms becomes the major premiss of the next, and the rules by which it is governed are that the first premiss only can be negative and the last particular. It may be stated thus:—

All E is F,  
 All D is E,  
 All C is D,  
 All B is C,  
 All A is B;  
 ∴ All A is F.

syllogism of the expanded Sorites a syllogism of the second figure. No advantage, however, is gained by this mode of statement, and it is not nearly so simple as the usual form.

## CHAPTER V.

### *On Complex (Hypothetical) Propositions and Syllogisms.*

HITHERTO we have treated only of simple (or, as they have been inaccurately termed, Categorical<sup>1</sup>) propositions and syllogisms. A *Complex* (or, as it is commonly called, a *Hypothetical*) Syllogism is one in which one or more complex (or hypothetical) propositions occur. A complex proposition is a combination of two or more simple propositions in one sentence, the propositions being so related that the truth or falsity of one proposition or set of propositions is made to depend on the truth or falsity of the other proposition or set of propositions. If the two propositions or sets of propositions be associated together, so that the truth of one depends on the truth of the other, the complex proposition may be called *Conjunctive*<sup>2</sup>. If they be dissociated,

<sup>1</sup> The word categorical (*κατηγορικός*) properly means affirmative, and is always used in that sense by Aristotle.

<sup>2</sup> We have, in accordance with more ancient usage, employed the word 'conjunctive' in place of the word 'conditional,' which is found in Aldrich and other logicians of his time. Instead of simple and complex propositions, they speak of categorical and hypothetical, subdividing hypothetical into conjunctive and disjunctive. Besides the improper use of

so that the truth of one depends on the falsity of the other, and the falsity of one on the truth of the other, the complex proposition may be called *Disjunctive*. Thus we may give as instances of Conjunctive Propositions:—

If (or When, Where, Provided that, &c.) A is B, C is D; If A is not B, C is D; If A is not B, C is not D; If A is B and C is D, E is F; If A is B, either C is D or E is F or G is H; If either A is B or C is D, E is F.

It will be noticed in the second and third examples that negatives are introduced, but they are, notwithstanding, examples of conjunctive propositions, for C being D in the first case, and C not being D in the second, are made to depend on the *truth* of A not being B. As instances of Disjunctive Propositions we may give the following:—

Either A is B, or C is D; Either A is B, or C is D, or E is F; A is either B or C or D; Either A or B or C is D; Either A is not B, or C is not D; Either A is B, or C is not D.

This form of proposition implies that the truth of one member involves the falsity of the other, and, *vice versâ*, the falsity of one member the truth of the other.

It should be noticed that both conjunctive and disjunctive propositions admit of being reduced to the simple form. Thus:—

the word categorical (noticed above), it is extremely awkward to make hypothetical and conditional (which are synonyms) stand respectively for the genus and species. The words conjunctive and disjunctive serve also to point out that the division of complex propositions is *exhaustive*.

'If A is B, C is D' becomes 'The case of A being B is a case of C being D' or 'A being B involves as a consequence C being D.'

The disjunctive proposition, when analysed, contains four conjunctive propositions, each of which may be reduced to a simple proposition. Thus, 'Either A is B, or C is D' is equivalent to the four conjunctive propositions: If A is B, C is not D; If A is not B, C is D; If C is D, A is not B; If C is not D, A is B.

We now proceed to consider Complex Syllogisms, i.e. syllogisms which contain Complex Propositions.

## § 2. I. *Conjunctive Syllogisms.*

A Conjunctive Syllogism is a syllogism, one or both of whose premisses are conjunctive propositions; if only one premiss be conjunctive, the other must be simple. If both premisses be conjunctive, inasmuch as all conjunctive propositions rank as universal affirmatives, the syllogism, to be valid, must be conformed to Barbara in the first figure. Thus,

If A is B, C is D,  
If C is D, E is F;  
∴ If A is B, E is F,

is a valid syllogism; but the following would not be valid:

If A is B, C is D,  
If A is B, E is F;  
∴ If C is D, E is F.

Far the most common form however of a conjunctive syllogism is that in which the major is a conjunctive, and the minor a simple proposition. Of this there are four possible varieties, of which two are valid and two invalid. These may be represented thus:—

If A is B, C is D. (Major Premiss.)

(1) A is B; $\therefore$ C is D.	(3) C is D; No conclusion.
(2) A is not B; No conclusion.	(4) C is not D; $\therefore$ A is not B.

Hence we obtain the rule that, if we affirm the antecedent, we must affirm the consequent, or, if we deny the consequent, we must deny the antecedent; but, if we deny the antecedent or affirm the consequent, no conclusion can be drawn. The reason of this will be obvious on a little reflection. We assert that 'A being B involves as a consequence C being D;' hence, if we grant that A is B, it must follow that C is D; if we deny that C is D, it must follow that what involves it as a consequence must also be untrue; but C might still be D, though A were not B, nor would it follow from C being D that A was also B.

Syllogism (1) is called a *Constructive* conjunctive syllogism.

Syllogism (2) is called a *Destructive* conjunctive syllogism.

It may be useful to add a few examples of valid conjunctive syllogisms.

- (1) If A is B, C is not D.  
C is D;  
∴ A is not B.
- (2) If A is not B, C is D.  
A is not B; | C is not D;  
∴ C is D. | ∴ A is B.
- (3) If A is not B, C is not D.  
A is not B; | C is D;  
∴ C is not D. | ∴ A is B.
- (4) If A is B, either C is D or F is G.  
A is B; | Neither C is D nor F is G;  
∴ Either C is D or F is G. | ∴ A is not B.
- (5) If either C is D or F is G, either X is Y or V is W.  
Either C is D or F is G; | Neither X is Y nor V is W;  
∴ Either X is Y or V is W. | ∴ Neither C is D nor F is G.

### § 3. II. *Disjunctive Syllogisms.*

A Disjunctive Syllogism is a syllogism of which the major premiss is a disjunctive, and the minor a simple proposition.

We may indeed combine two disjunctive propositions, and draw conclusions from them, but we can only do so after reducing the disjunctive propositions to the conjunctive form. Thus from the two propositions Either A is B or C is D, Either A is B or E is F, we may draw

(5) Either A is B or C is D;  $\therefore$  E is not F.

&c.

&c.

He is either a fool or a knave.

(1) He is a fool;  
 $\therefore$  He is not a knave.

(2) He is a knave;  
 $\therefore$  He is not a fool.

(3) He is not a fool;  
 $\therefore$  He is a knave.

(4) He is not a knave;  
 $\therefore$  He is a fool.

*Note.*—Mr. Mill (in his *Examination of Sir W. Hamilton's Philosophy*, ch. xxiii.) maintains that a disjunctive proposition simply implies that the two alternatives cannot both be false, but that it does not exclude the possibility of both of them being true. Thus, in the last example, he would maintain that there is nothing in the form of the assertion to exclude the supposition of the man being both a fool and a knave. In this opinion he is preceded by many other logicians, but it seems to us that in the expression 'either —or—' we distinctly exclude the possibility of both alternatives being true, as well as of both being false. In fact, when we do not wish to exclude the possibility of both being true, we add the words 'or both,' thus: 'He is either a fool or a knave, or both;' 'I shall come either to-day or to-morrow or perhaps both days.'

§ 4. *The Dilemma.*

There remains the case in which one premiss of the complex syllogism is a conjunctive and the other a disjunctive proposition. This is called a *Dilemma*. The order of the premisses is indifferent, but it seems more natural that the conjunctive proposition should be the major. If we consider the case in which the major consists of one antecedent and several consequents, there is only one valid form of argument, and that is destructive.

- (1) If A is B, C is D and E is F ;  
       But either C is not D or E is not F ;  
       ∴ A is not B.

If we asserted in the minor 'C is D and E is F' there would be no conclusion, and if we asserted 'Neither C is D nor E is F,' the minor would not be disjunctive. The assertion 'Either C is D or E is F' is, according to our view of the significance of a disjunctive proposition, equivalent to the assertion 'Either C is not D or E is not F,' and leads to the same conclusion.

If the major consist of several antecedents and one consequent, there is only one valid form of argument, and that is constructive.

- (2) If A is B or if E is F, C is D ;  
       But either A is B or E is F ;  
       ∴ C is D.

If we asserted in the minor 'C is not D,' it would not satisfy the requirements of the definition by being a disjunctive proposition.

In the remaining case, where there are several antecedents and several consequents, there are two valid forms, one constructive and the other destructive.

- (3) If A is B, C is D; and if E is F, G is H;  
But either A is B, or E is F;  
∴ Either C is D, or G is H.

- (4) If A is B, C is D; and if E is F, G is H;  
But either C is not D, or G is not H;  
∴ Either A is not B, or E is not F.

It is evident that we may form a Trilemma, Tetralemma, &c., by increasing the number of antecedents or consequents or both, thus:—

- If A is B, or if E is F, or if G is H, C is D;  
But either A is B, or E is F, or G is H;  
∴ C is D.

- If A is B, C is D; and if E is F, G is H; and if  
I is J, K is L;  
But either A is B, or E is F, or I is J;  
∴ Either C is D, or G is H, or K is L.

It is not uncommon to mistake for a dilemma what is really only a conjunctive syllogism. Thus the two following syllogisms, when examined, will be found to be, the first a constructive, the second a destructive conjunctive.

## 116 COMPLEX PROPOSITIONS AND SYLLOGISMS.

- (1) Whether geometry be regarded as a mental discipline or as a practical science, it deserves to be studied ;

But geometry may be regarded as both a mental discipline and a practical science ;

∴ It deserves to be studied.

- (2) If we go to war, we must either contract a debt, or increase the taxation, or indemnify ourselves at the enemy's expense ;

We shall not be able to do any of these ;

∴ We are not able to go to war.

In disputation, the adversary who is refuted by a dilemma is said to be ' fixed on the horns of a dilemma ;' he is said to *rebut* the dilemma, if he meet it by another with an opposite conclusion. Thus (to tell an old story) Protagoras the Sophist is said to have engaged with his pupil, Euathlus, that half the fee for instruction should be paid down at once, and the other half remain due till Euathlus should win his first cause. Euathlus deferred his appearance as an advocate, till Protagoras became impatient and brought him into court. The Sophist then addressed his pupil as follows : " Most foolish young man, whatever be the decision, you must pay your money ; if the judges decide in my favour, I gain my fee by the decision of the court, if in yours by our bargain." This dilemma Euathlus *rebutted* by the following : " Most sapient master, whatever be the decision, you must lose your fee ; if the judges decide it in my favour, you lose it

by the decision of the court, if in yours, by our bargain, for I shall not have gained my cause."

---

*Note.*—Of the four cases of dilemma which we have given, the first would not be admitted by Abp. Whately and Mr. Mansel, who define dilemma as 'A syllogism having a conditional (i.e. conjunctive) major premiss with more than one antecedent, and a disjunctive minor.' Having however a disjunctive minor, it cannot properly be regarded as a conjunctive syllogism, and it seems less arbitrary and more systematic to define dilemma as 'a syllogism of which one premiss is a conjunctive and the other a disjunctive proposition' than to limit it as above.

Few parts of Logic have given more occasion to differences of opinion or nomenclature than the theory of complex (or hypothetical) propositions and syllogisms. Sir W. Hamilton (see Appendix viii. to his *Lectures on Logic*) finally arrives at the opinion that "hypothetical and disjunctive judgments" are less complex than ordinary propositions, and that "hypothetical and disjunctive reasonings" are really forms of immediate inference. Thus he would represent the conjunctive syllogism in the form:—

If A is B, C is D;

∴ A being B, C is D.

The disjunctive syllogism he would represent in the form:—

Either A is B, or C is D;

∴ A not being B, C is D.

The other inferences from the premisses would, of course, be drawn similarly.

The dilemma would assume the form :—

If A is B, C is D ; and if E is F, G is H ;

∴ either A being B, or E being F, it follows that

C is D, or G is H ;

or ∴ either C not being D, or G not being H, it follows  
that either A is not B, or E is not F.

## CHAPTER VI.

### *On the words 'Most,' 'Many,' &c., as expressing the Quantity of Propositions.*

TO all particular propositions we have prefixed the word 'some.' Both in conversation and reasoning, however, it frequently happens that we use some other sign of particularity, such as 'many,' 'most,' &c. Nor does there seem any valid reason why these forms should not be recognised by Logic. From what has already been said of particular premisses, it will be seen that wherever one premiss is universal and the other modified by some sign of particularity, as 'some,' 'many,' 'most,' &c., the conclusion must be modified by the same sign of particularity which is attached to the particular premiss. Thus, if we state as our premisses 'All crimes are to be punished,' 'Many offences against individual persons are crimes,' we must draw the conclusion that 'Many offences against individual persons are to be punished.'

'Two particular premisses prove nothing.' This is a general rule, and is strictly true where the premisses are quantified as 'some' — 'some.' But there is one case in which two particular premisses necessitate a conclusion. We will commence with a simple instance of it.

If two different predicates can both be predicated affirmatively of the greater number of individuals denoted by the same common term, there must be some individuals of which they can both be predicated, i.e. in certain cases the predicates must be predicable of each other. Thus, from the premisses

Most A are B,

Most A are C,

we must necessarily infer that Some B are C and Some C are B.

But we may draw the same conclusion, even in those cases in which both premisses are not quantified by the word 'most,' provided that the sum of the quantities by which the subjects are affected exceeds unity. Thus, from the premisses

Three-fourths of A are B,

One-third of A is C,

it follows that at least one-twelfth of A is both B and C; but if B and C be both predicable of the same objects, either must be, partially, predicable of the other. If, for instance, three men out of four exceed a certain height and one out of three a certain weight, at least one out of twelve must exceed both the given height and the given weight, and we may affirm both that Some men who exceed a certain height also exceed a certain weight, and that Some men who exceed a certain weight also exceed a certain height.

Of course, when we use such an indefinite word as 'most' in either premiss, the other premiss must be

quantified by an expression signifying at least one-half; else we cannot be sure that the quantities of the two premisses, when added together, exceed unity.

A conclusion of this kind can only be drawn where the subject in both premisses is the same term, i.e. in the third figure; for, in a logical proposition, we have no data to guide us with regard to the quantity of the predicate. Thus, from the premisses

Nineteen-twentieths of A are B,

Nine-tenths of B are C,

we can draw no conclusion as to the relation of A and C; for the tenth of B which is not C might be precisely that portion which was coincident with, or which contained, the nineteen-twentieths of A. Though, however, these syllogisms are confined to the third figure, they may be either affirmative or negative. Thus, from the premisses

Three-fourths of A are not B,

Two-thirds of A are C,

we may infer that five-twelfths at least of A are C and not B, and consequently that some C is not B, and some things which are not B are C.

It will be noticed that the conclusions of which we have been speaking are inferred with certainty, and are therefore to be distinguished from the conclusions in probable reasoning, which we are now about to discuss.

## CHAPTER VII.

### *On Probable Reasoning.*

IN discussing the copula, it was maintained that any modification of our assertions, such as the qualifications introduced by the words 'probably,' 'possibly,' &c., was, in the ultimate analysis of the proposition, to be referred to the predicate and not to the copula. Thus such a proposition as 'A is probably B,' when stated in its strictly logical form, would become 'That A is B is a probability.' It would however be tedious and practically useless to reduce all our propositions to such a form. We may therefore proceed to lay down rules for reasoning from propositions whose copula is modified, remembering however that they are not stated in strictly logical language.

The correctness of the following rule will be apparent. If a premiss whose copula is modified be combined with another premiss whose copula is unmodified, the copula of the conclusion must be modified also; the modality, of course, being the same as that in the premiss. Thus from the premisses 'All true poets are men of genius,' 'Sophocles is probably (certainly, possibly, &c.) a true poet,' I infer that Sophocles is probably (certainly, pos-

sibly, &c.) a man of genius. From a certain and a probable premiss, therefore, arranged according to the ordinary laws of syllogism, is to be inferred a probable conclusion. To this head may most conveniently be referred those syllogisms in which the major is a particular proposition introduced by the word 'most,' and the minor a singular proposition. Thus from the premisses, 'Most philosophers are men of vivid imagination,' 'A B is a philosopher,' I infer, as the conclusion, A B is probably a man of vivid imagination. If *most* philosophers possess certain characteristics, any particular philosopher will *probably* possess them, so that the major premiss is, in fact, equivalent to the proposition, 'A philosopher is probably a man of vivid imagination.'

Using the word 'probable' in the sense of 'more likely than not,' two probable premisses do not lead to a probable conclusion. This will be obvious from an easy example. Suppose there are in a bag four red, five blue, and six white balls; I may say with truth 'Any ball drawn at random from the bag is probably a red or blue ball;' I may also say with truth 'Any ball drawn at random from the red and blue balls is probably a blue ball;' but I cannot infer that 'Any ball drawn at random from the bag is probably a blue ball.' I shall only be justified in drawing the conclusion 'Any ball drawn at random from the bag is *possibly* a blue ball.' But, where our information is so special as in the above instance, a conclusion of this kind is far too vague. Is there no method which will enable me to state in the

conclusion the exact value of the expectation that any particular ball drawn at random may be blue, red, or white? For such a method I must have recourse to mathematics.

Though the word 'probable' is used in the sense of 'more likely than not,' the word 'probability' is used as the equivalent of 'chance' or 'expectation.' If it be three to two that a certain event will happen, 3 : 2 is called the *odds* for, 2 : 3 the *odds* against the event. Now the 'probability' or 'chance' of the event happening would be expressed by  $\frac{3}{5}$ , that of its not happening by  $\frac{2}{5}$ , the denominator in both cases being expressed by the sum of the terms of the odds, the numerator in the first case by the term of the odds for, in the latter case by the term of the odds against. If two events are independent of each other, the joint or compound probability that they will both happen must be much smaller than the probability that either of them will happen alone, and it is discovered by multiplying together the fractions which express the probabilities of their happening separately<sup>1</sup>. Thus, in the above instance, the chance of my drawing a red or blue ball =  $\frac{9}{15}$ ; the chance of my drawing out of the red and blue balls a blue ball =  $\frac{5}{9}$ ;  $\therefore$  the chance of my drawing a blue ball out of the bag which contains all =  $\frac{9}{15} \times \frac{5}{9} = \frac{1}{3}$ , a result at which, in this particular instance, I could of course have arrived more directly.

<sup>1</sup> The truth of this proposition, with regard to two, three, or any number of events, is proved at length in Peacock's *Arithmetical Algebra*, § 469.

Hence, when both premisses are affected by words like 'probably,' 'possibly,' &c., the probability of the conclusion may always be discovered by multiplying together the probabilities of the premisses, the conclusion being therefore less probable than either premiss. We append a few instances of conclusions drawn from probable premisses :—

- (1) This plant will probably sprout up during the winter months. (Let the probability =  $\frac{3}{8}$ .)

Whatever plant sprouts up during the winter will probably be bitten by the frost. (Let the probability =  $\frac{4}{7}$ .)

∴ This plant may be bitten by the frost. (Here the probability =  $\frac{3}{8} \times \frac{4}{7} = \frac{1}{3}\frac{2}{5}$ .)

∴ The odds *against* the plant being frost-bitten are 23 to 12, and those *in favour* of its being frost-bitten are 12 to 23.

- (2) Two-thirds of these men will be enlisted.

Half the men enlisted are killed in battle.

∴ The probability of any particular man being killed in battle =  $\frac{2}{3} \times \frac{1}{2} = \frac{1}{3}$ .

∴ It is two to one against any particular man here being killed in battle.

- (3) A warm day may possibly be a rainy day. (Let the probability =  $\frac{1}{3}$ .)

A rainy day is probably not a windy day. (Let the probability =  $\frac{4}{5}$ .)

∴ A warm day may possibly not be a windy day. (The probability =  $\frac{4}{15}$ .)

The last example is useful as shewing the beginner that a conclusion highly probable in itself may receive little support from the premisses.

It is perhaps needless to remark that premisses, one or both of which are probable (possible, &c.), may be combined in any of the legitimate moods.

N. B.—It is most important for the student to bear in mind the ambiguous use of the words ‘probably,’ ‘probable,’ ‘probability.’ The adverb ‘probably’ we seem always to use in the sense of ‘more likely than not.’ The adjective ‘probable,’ when employed as a predicate, seems also to be invariably used in the same sense; thus we say ‘It is probable that he will do so and so,’ ‘This event is probable.’ But when used to qualify a substantive, as in such expressions ‘probable premisses,’ ‘probable reasonings,’ &c., it may either be employed in the above sense or simply as contrasted with certainty, and in the latter case the ‘probability,’ as we say, may vary from certainty to zero. Lastly, the word ‘probability’ may simply be equivalent to ‘chance,’ as explained above, or in some expressions it may have the meaning of ‘being more likely than not,’ as when we say ‘The probability is that he will do so and so.’ By ‘probable reasoning’ at the head of this section we of course mean reasoning which falls short of certainty, and the value of which may vary to any extent so long as it does not rise to certainty or fall to zero.

*On Circumstantial Evidence.*

Probable arguments may be combined together in a chain (or rather, as it has been called, a coil) of reasoning, each argument leading to the same conclusion. Instead of weakening each other, as is the case with probable premisses, such arguments, being all independent testimonies to the truth of the same conclusion, mutually strengthen each other. If the value of any single argument amounts to certainty, the conclusion must be true. In this case therefore we have to calculate the chances of failure in each separate argument; these, when multiplied together, give the probability of all the arguments together failing to prove the conclusion; and this fraction, when subtracted from unity (which represents certainty), gives the probability, resulting from all the arguments jointly, in favour of the conclusion. Thus suppose the probabilities in favour of certain probable arguments to be represented respectively by  $\frac{1}{3}$ ,  $\frac{2}{3}$ ,  $\frac{3}{4}$ ; the chances of their failing to prove the conclusion will be represented respectively by  $\frac{2}{3}$ ,  $\frac{1}{3}$ ,  $\frac{1}{4}$  (or the differences between the favourable chances and unity); the chance therefore of their all failing to prove the conclusion  $= \frac{2}{3} \times \frac{1}{3} \times \frac{1}{4} = \frac{1}{10}$ ; consequently the probability in favour of the conclusion, as based upon all the arguments jointly, is  $\frac{9}{10}$ , i. e. the odds in favour of it are 9 to 1.

We may illustrate this case by an example, which will also serve to shew the characteristic uncertainty attaching

to this method of reasoning. Suppose a man to be found lying dead on a road from the effects of a wound. On the same evening on which he died, another man was seen running away from the neighbourhood of the place. On this man's house being searched, his clothes are found to be stained with blood; his foot-steps correspond with those leading to and from the place where the dead man was lying; and moreover he is known to have possessed a weapon, now not to be found, which was capable of inflicting the wounds. The presumption in favour of his guilt is very great; each argument, taken alone, possesses some cogency, and when all the arguments are taken together they appear to be irresistible. But suppose the suspected man, when arrested, to give this account of the affair: he was walking along the road, armed with a dagger; he was suddenly attacked by another man; a scuffle ensued, and in the scuffle he killed his assailant; finding that he had killed him, he was seized with a sudden panic, threw away his weapon, and ran home. Such an account, in the case of a timid and secretive man, might possibly be true, and in estimating the counter-probabilities, we should have to consider the characters of the accused and the dead man, and the nature of the motive, if any, which could have led to the supposed crime. Suppose the dead man's pockets were rifled, and the accused (who had been previously convicted of a felony) were in possession of his money, there could be little doubt that he had committed a murder; but suppose that the

character of the accused was good, and no likely motive could be assigned for the commission of the crime, his own version of the affair might be accepted as probably true, or at least as throwing considerable doubt on the supposition of his guilt<sup>2</sup>.

Evidence of the kind we have been discussing is called *Circumstantial Evidence*, from the fact that several circum-

<sup>2</sup> As illustrating the danger of exaggerating the value to be attached to circumstantial evidence, we could hardly adduce a more forcible example than the following passage from Lord Coke (quoted by Bentham in his *Rationale of Judicial Evidence*, bk. v. ch. 15, § 2):—

“Violenta presumptio is many times plena probatio; as if one be run thorow the bodie with a sword in a house, whereof he instantly dieth, and a man is seen to come out of that house with a bloody sword, and no other man was at that time in the house.”

To this Bentham replies by two counter-suppositions:—

“1. The deceased plunged the sword into his own body, as in the case of suicide: the accused, not being in time to prevent him, drew out the sword, and so ran out, through confusion of mind, for chirurgical assistance.

“2. The deceased and the accused both wore swords. The deceased, in a fit of passion, attacked the accused. The accused, being close to the wall, had no retreat, and had just time enough to draw his sword, in the hope of keeping off the deceased: the deceased, not seeing the sword in time, ran upon it, and so was killed.

“Other suppositions might be started besides these; nor do these exculpatives either of them seem in any considerable degree less probable than that criminative one: if so, the probability of delinquency, instead of being conclusive, is but as 1 to 2.”

Sometimes the individual arguments in a chain of circumstantial evidence are of so little value that, even when several of them are accumulated, they have no practical force. “Presumptio probabilis,” Lord Coke says rightly, “moveth but little, but presumptio levis seu temeraria moveth not at all.”

## CHAPTER VIII.

### *On Fallacies.*

§ 1. A FALLACY is, strictly speaking, a defective inference, but the word is, by common usage, extended to any error either in the premisses or in the conclusion of our arguments. In deductive Logic (for we are here concerned with the fallacies incident to induction or to the operation subsidiary to it, observation) errors are traceable to one of four sources: the as

1 The fallacy of False Analogy (which consists either in over-estimating in some particular case, the value of the argument from analogy, or in supposing an analogy where none exists) falls properly within the domain of inductive Logic. It is not to be confounded with the fallacy of equivocation, which consists in the employment in a syllogism of a word used analogously, where it was used univocally, which, as already noticed, is a case of the fallacy of ambiguous terms. Thus to argue, because there is a certain resemblance between the development of the human mind and the development of the race, that, therefore, since the human mind dies, the race probably die also, or, because there is a certain resemblance of nature between the earth and the other planets, that, therefore, the other planets are certainly, or very probably, inhabited, would be a case of the fallacy of false analogy, the former being a case of over-estimation, the latter of exaggeration of the value of the argument. But to argue, because a man of great intellectual gifts and a man of great industry and perseverance require the same amount of sleep, that, therefore, all men require the same amount of sleep, would be a case of the fallacy of ambiguous terms, the word "require" being used in two different senses, one of necessity, the other of language.

tion of a false premiss, neglect of the laws of deductive inference, irrelevancy, and ambiguity of language. Any conclusions therefore, or series of conclusions, which transgress no law of inference, which are derived from true premisses, which are relevant to the matter under discussion, and which, with their premisses, are expressed in unambiguous language, may be regarded as faultless.

§ 2. I. A false premiss, borrowed from some science which is not under investigation, can only be detected by a special knowledge of the science from which it is taken. Many fallacies, described in the old books on Logic, are really instances of the assumption of a false premiss, and therefore specially concern other sciences rather than logic. Thus the celebrated fallacy of Achilles and the tortoise assumes as its major premiss a false proposition, viz. 'that the sum of an infinite series of constantly decreasing terms is an infinite number.'

§ 3. II. The fallacies due to the neglect of the laws of deductive inference (which, strictly speaking, are the only fallacies to be detected by a mere knowledge of Deductive Logic) have already, to some extent, been discussed. The principal sources of fallacy in a single inference are illicit process and undistributed middle. A not infrequent instance of undistributed middle is the following :—

All Conservatives (Liberals, Roman Catholics, Protestants, Englishmen, Frenchmen, &c.) hold such and such opinions, do such and such things, or possess such and such characteristics ;

§ 4. III. The fallacy of Irrelevancy (or, as it is sometimes called, shifting ground) is technically termed *Ignoratio Elenchi*, i. e. ignorance of the syllogism required for the refutation of an adversary. Thus, in the strictest sense of the words, *ignoratio elenchi* is committed by a person who in a disputation does not confine himself to proving the contradictory of his adversary's assertion, or who proves a proposition other than the contradictory. But, like many other terms borrowed from the dialectical disputations of the ancients, this has now received a wider meaning. Whenever an argument is irrelevant to the object which a speaker or writer professes to have in view, it is called an *ignoratio elenchi*. Thus, if I am endeavouring to convince a person that some particular measure is for his personal interest, and I adduce arguments to prove that it contributes to the general utility, or that it is the necessary consequence of other acts of legislation, I am guilty of an *ignoratio elenchi*, as I should also be if, when it was my object to establish either of the other two conclusions, I were to appeal to his personal interest. When the question at issue is the

principii. Of course the controversy entirely turns upon the meaning of the terms, but, according to the account we have given of the two, a syllogism is so far from being a *petitio principii*, that every *petitio principii* is a distinct breach of the laws of syllogism. The conclusion of a syllogism is indeed implied by the two premisses taken in combination, but, in a *petitio principii*, the conclusion is merely a re-assertion of one of the premisses: in the simpler cases, of a premiss in the same syllogism; in the argument in a circle, of a premiss in one of the preceding syllogisms of the series.

truth of an opinion, it is an *ignoratio elenchi* to attack it for its novelty, or for its coming from a foreign source, or for any supposed consequences which may result from it, or to try to throw discredit on its author by saying that it has often been started before, and so is no discovery of his.

This fallacy is more common in spoken addresses than in books, as the feelings both of speaker and auditory being more excited, and their judgment less critical, they are less likely to insist on relevancy of argument. On such occasions it most commonly takes the form of an *argumentum ad hominem*, whereby the speaker, in support of the truth of his assertions, or to throw discredit on an adversary, appeals, not to the unbiassed judgment of his auditors, but to their passions, interests, prejudices, sentiments, and associations. The *argumentum ad hominem*, however, is not confined to set speeches; it sometimes occurs in writings, and frequently in debates. In the latter, it often assumes the shape of an appeal to the previous acts, or the previously expressed convictions of the opponent; 'That measure, or that argument, or that proposal does not come well from you, who once proposed such a measure, or expressed such an opinion, or advanced such an argument, or did such and such acts.' There are occasions when the *argumentum ad hominem* may legitimately be used as a retort, but it must be advanced as such, and not as an argument. It is so called in opposition to the *argumentum ad rem* or *ad judicium*. Similar phrases are used to express other

forms of the *ignoratio elenchi*, as e.g. the *argumentum ad verecundiam*, *argumentum ad baculum*, &c. The *argumentum ad populum* we have treated as identical with the *argumentum ad hominem*; if called on to distinguish them, which seems unnecessary, we should refer the first to addresses made in the presence of a large auditory, the second to disputations with one or a few individuals<sup>6</sup>.

§ 5. IV. The fallacies originating in ambiguity of language we noticed when warning the student against the employment of equivocal terms. This fallacy (whether we call it that of equivocal terms, of ambiguous terms, or of ambiguity of language) of course includes fallacies arising from any ambiguity which may attach to the quantity of the subject, as e.g. the fallacy arising from the ambiguous use of the word 'all,' which will be noticed below.

We now proceed to notice one or two common cases of this fallacy. The same term may often be used in one place distributively and in another collectively, and we may argue as if the term in both places had the same meaning. This is called the fallacy of *Composition* or *Division*; of composition, if we argue from a term taken distributively as if it were taken collectively; of division, if we argue from a term taken collectively as if it were taken distributively. Thus (to give one of the common instances) 7 and 2 are (distributively) odd and even,

<sup>6</sup> The student will find some amusing examples of *ignoratio elenchi*, or irrelevant argument, in Sydney Smith's well-known *jeu d'esprit*, the *Noodle's Oration*. •

nine is 7 and 2 (collectively);  $\therefore$  nine is odd and even. Here we argue from 7 and 2 taken distributively, as if they had been taken collectively, and the fallacy is one of composition. Again, The people of England have a prejudice against the French, he is one of the people of England;  $\therefore$  he has a prejudice against the French. The major premiss might be quite true, and still the particular man spoken of might have a strong sympathy with the French, and be a warm admirer of their institutions. Here we argue from the term 'people,' taken collectively, as if it had a distributive signification and whatever were predicable of the English people might be predicated of every single individual amongst them; hence the fallacy is one of division. The last instance is an example of a very common source of deception. A certain people, corporation, or society, in its collective capacity, has certain characteristics, has performed certain acts, passed certain resolutions, or is known to have expressed certain sentiments; hence it is unreflectingly supposed that any particular individual belonging to the class has the same characteristics, participates in the same sentiments, and has joined in the same acts. In many cases, of course, he may be a strong dissident, and may have actively opposed the measures adopted.

The ambiguous use of the word 'all' furnishes a good instance of the fallacies of composition and division. We may argue from 'all,' meaning all taken together, as if it meant all severally, and thus commit the fallacy of division; or from 'all,' meaning all severally, as if it

meant all taken together, and thus commit the fallacy of composition. Thus, when I say 'All these boxes weigh so much,' or 'All these men can eat so much,' I leave it doubtful whether I mean all taken together or all taken severally. The ambiguity may be removed by substituting for the word 'all,' when used in a distributive sense, 'every,' and, when used in a collective sense, 'the whole of.'

Another pair of fallacies which falls under the head of 'ambiguous terms' is the pair known as the *Fallacia Accidentis* (or the *Fallacia a dicto simpliciter ad dictum secundum quid*) and the *Fallacia a dicto secundum quid ad dictum simpliciter*. In the first we argue from what is true as a general rule (i.e. unless there be some modifying circumstances) as if it were true under all circumstances; in the second from what is true under certain special circumstances as if it were true as a general rule. Thus a particular walk may be an agreeable one, but it does not follow that it would be so in wet or windy weather; plain-speaking, frugality, generosity, may all be virtues, but it does not follow that it would be virtuous to practise them on all possible occasions. Or, to take instances of the second fallacy, a political revolution may, under particular circumstances, be necessary to the welfare or existence of a country, but it does not follow that a state of society, in which political revolutions are frequent, is either necessary or desirable; it may be necessary if I am suffering from a particular disease that I should take opium or abstain from labour, but it does not follow that these would be good for me when I am

restored to health. These fallacies are due to our not sufficiently qualifying the terms which we use, and, by insisting on precision of language, they may always be avoided.

Though the definitions we have given of this pair of fallacies are conformable to the usage of most modern logicians<sup>6</sup>, and are stated in a form which is most likely to be of practical service to the student, they do not exactly correspond with the original meaning of the expressions. The ‘Fallacia Accidentis’ and the ‘Fallacia a dicto secundum quid ad dictum simpliciter,’ according to their original usage, applied to those cases in which a term, when not implying accidents, was confounded with the same term, when implying accidents. Thus, to take the common instance (which is sufficiently absurd): ‘What you buy in the market, you eat; raw meat is what you buy in the market; ∴ raw meat is what you eat.’ Here it may be replied that what we buy in the market we do indeed eat, but not necessarily in the same state in which we buy it at market<sup>7</sup>. This particular instance is an

<sup>6</sup> As, for instance, Mill (*Logic* bk. v. ch. 6, § 4), *Port Royal Logic* (part iii. ch. 19, § 5, 7). The latter virtually treats both fallacies as if they were a dicto secundum quid ad dictum simpliciter.

<sup>7</sup> Mr. De Morgan adduces one of Boccaccio’s stories as affording an amusing instance of the fallacia accidentis. It is the old example of the ‘raw meat’ in another form:—

“A servant who was roasting a stork for his master was prevailed upon by his sweetheart to cut off a leg for her to eat. When the bird came upon table, the master desired to know what was become of the other leg. The man answered that storks had never more than one leg. The master, very angry, but determined to strike his servant dumb

example of the Fallacia Accidentis. From their technical meaning, these fallacies would easily pass into their present signification, which is both more intelligible and of greater practical service.

We may notice one more example of the errors due to ambiguous language, viz. the fallacy of what may be called *Paronymous Terms*. The same word may often assume different forms, as substantive, adjective, adverb, or verb, but it does not follow, when it has assumed these different forms, that they all retain corresponding meanings. It has been already noticed that the words probably, probable, probability, though the two last are themselves ambiguous, vary in meaning, according as we use the adverb, the adjective, or the substantive. Thus, if I hear some one ask the question 'What is the probability of my throwing an ace with a die at a single throw?', I cannot infer that in any single throw I shall probably throw an ace. Again, because a man has committed an unjust act (i.e. an act which in its results is unjust), I cannot infer that he has acted unjustly (i.e. with intentional injustice), nor, even if he has acted unjustly (i.e. in one or more instances), can I infer that he is an unjust man (i.e. a man of unjust habits or character). To take an old instance, because projectors are unfit to be

before he punished him, took him next day into the fields where they saw storks, standing each on one leg, as storks do. The servant turned triumphantly to his master, on which the latter shouted, and the birds put down their other legs and flew away. 'Ah, sir,' said the servant, 'you did not shout to the stork at dinner yesterday: if you had done so, he would have shewn his other leg too.'"

trusted, and this man has formed a project, it does not follow that he is unfit to be trusted. Nor from the meanings attached to the adverbs, kingly, nobly, gentlemanly, can we argue to the usual qualities of a king, a nobleman, or a gentleman; nor, on the meanings of the words 'to trow,' 'to represent,' can we base any sound argument as to the nature of truth, or the duties of a representative. All instances of this fallacy, when stated syllogistically, involve four terms, and so offend against the rules for the construction of a syllogism, but, as we do not ordinarily state our arguments in a syllogistic shape, and these fallacies undoubtedly impose on us through the ambiguity of language, it is better to consider them here rather than under the second head.

Many other forms of fallacy may be regarded as due to ambiguities of language, but it has perhaps been the tendency of modern logicians, and especially of Whately, to overload this division of fallacies, and to treat as merely differences of language what are in reality radical differences of opinion. At the same time, it cannot be denied that terms expressive of fundamental conceptions in their several sciences, such as faith, church, election, law, loyalty, federation, justice, value, capital, force, nature, natural, &c., are frequently used, in the same discussion, in the most widely divergent senses, and are consequently the source of endless confusion in our reasonings. Thus the term 'faith' may mean either a *belief* in certain propositions, or *confidence*, trust, and repose in a certain person; the word 'church' may mean the whole body of Christians (and,

of course, in this sense its signification will vary according to the meaning attached to the term Christian), a particular section of Christians, a congregation meeting in a certain place, the place of meeting, and, lastly, by a strange perversion of the term, the clergy as distinguished from the laity ; the term 'loyalty' may mean either attachment to the laws of a country in general, special attachment to some particular portion of the laws, or, in its most restricted sense, personal attachment to the supreme ruler ; 'capital' may mean either the amount of money possessed by a trader, or his whole stock of commodities available for future production ; 'natural' may express either the original condition of a thing, or the state into which it is ultimately developed, besides having countless other meanings. On account of the various significations which may be attached to the same term, it is necessary, in entering on any investigation, carefully to define the terms to be employed, and never, without express notice, to deviate from the sense thus imposed upon them.

## CHAPTER IX.

### *On Method as applied to the arrangement of Syllogisms in a Train of Reasoning.*

WE do not propose to treat of Method in general (for this would involve a discussion of induction and the various relations in which it stands to deductive inference), but it may be useful to the student if we offer a few remarks on Method under the limitation stated in the heading of this chapter. When syllogisms are combined in a train of reasoning, we may either commence with the conclusion, and ask what reasons we have for believing it, and then go on to ask the reasons for believing the premisses, and so on, till at last we arrive at some propositions of which there is no doubt, or in which we at least can acquiesce; or else we may follow the reverse process, and commencing with propositions which are the result of some previous investigation, or which we at all events accept as true, may go on combining them with each other, till at last we arrive at some conclusion which we regard as sufficiently important to terminate our enquiries. The former method will be familiar to our readers as that by which we solve algebraic equations and what are called 'geometrical deductions,' and in fact as the method which

we generally though not universally employ when we are attempting to resolve difficulties for ourselves; the latter as the method by which the propositions in Euclid are proved, and in fact as the method which we generally though not universally employ, when it is our object to teach others, either orally or by book. Now the former method is called *Analytical* (from the Greek word ἀνάλυσις), because it may be regarded as the breaking up of a whole into its parts, the resolution of the final conclusion of a series of syllogisms into the various premisses on which it depends, and of which it is, as it were, the total expression. The latter method is called *Synthetical* (from the Greek word σύνθεσις), because it may be regarded as the putting together of the parts into a whole, the combination of the various premisses into a conclusion which is, as it were, their total result. Similarly in chemistry we speak of the analysis of any compound substance into its constituent elements, or of the synthesis of the constituent elements into the compound substance.

The words *a priori* and *a posteriori* may also be used to express the same distinction. In inductive inference (to which these terms are more properly applied) we are said to proceed *a posteriori*, when, a certain event having taken place, we attempt to trace the steps by which it came about, or, a certain phenomenon being presented to us for examination, we attempt to infer the mode of its production; and, vice versâ, we are said to proceed *a priori*, when, from our knowledge of certain circumstances, we attempt to predict an event, or, by putting in opera-

tion certain causes, we attempt to discover their effect. Similarly, in deductive inference, if, a conclusion being assumed as provisionally true, we attempt to discover reasons for it, we may be said to proceed *a posteriori*; if, starting with the premisses, we go on combining them to see whither they will lead us, we may be said to proceed *a priori*. In the former method of reasoning, we are peculiarly liable to impose on ourselves or others by availing ourselves of premisses which are fanciful, obscure, incapable of proof, questionable, or untrue, especially if the conclusion express some cherished conviction or some position which it is the interest of ourselves, our class, or our party to accept and to disseminate. Whenever, therefore, we argue from our conclusions backwards, especial caution is required, if it be our sincere desire to test our convictions impartially.

---

*Note.*—For an account of the various senses in which the words ‘analysis’ and ‘synthesis’ are or have been employed the student is referred to Sir W. Hamilton’s *Lectures on Logic*, Lect. xxiv, and Mr. Mansel’s Edition of *Aldrich*, Appendix G.

## Clarendon Press Series.

Books already published, and nearly ready for publication.

1. **Chemistry for Students.** By A. W. WILLIAMSON, Phil. Doc., F.R.S., Professor of Chemistry, University College, London. (Crown 8vo., cloth, price 7s. 6d.)

Also: **Solutions of the Problems in "Chemistry for Students."** By the same Author. (Sewed, price 6d.)

2. **Greek Verbs, Irregular and Defective;** their forms, meaning, and quantity; embracing all the Tenses used by Greek writers, with references to the passages in which they are found. By W. VEITCH. New and revised edition. (Crown 8vo., cloth, 616 pp., price 8s. 6d.)
3. **An Elementary Treatise on Heat, with** numerous Woodcuts and Diagrams. By BALFOUR STEWART, LL.D., F.R.S., Director of the Observatory at Kew. (Crown 8vo., cloth, price 7s. 6d.)
4. **The Elements of Deductive Logic,** designed mainly for the use of Junior Students in the Universities. By the Rev. T. FOWLER, M.A., Fellow and Tutor of Lincoln College, Oxford. (Crown 8vo., cloth, price 3s. 6d.)
5. **The Golden Treasury of Ancient Greek** Poetry; being a Collection of the finest passages in the Greek Classic Poets, with Introductory Notices and Notes. By R. S. WRIGHT, M.A., Fellow of Oriel College, Oxford. (Crown 8vo., cloth, price 8s. 6d.) [Ready.]
6. **Specimens of Early English; being a Series** of Extracts from the most important English Authors, Chronologically arranged, illustrative of the progress of the English Language and its Dialectic varieties, from A.D. 1250 to A.D. 1400. With Grammatical Introduction, Notes, and Glossary. By R. MORRIS, Esq., Editor of "The Story of Genesis and Exodus," &c. (Crown 8vo.) [Nearly ready.]

MACMILLAN and Co. London.

November, 1866.]

## UNIVERSITY OF OXFORD.

### Clarendon Press Series.

THE DELEGATES of the Oxford Press understand from eminent Schoolmasters and others who are authorities upon education, that there is still great need of good School Books and Manuals.

They are told that Editions with good English notes of many of the Greek and Latin Classics read in the higher classes of the Public Schools are required; that text-books, both English and Foreign, are much needed for the use of Schools, especially with reference to the Local Examinations held by the Universities; that good English and other Grammars, and Exercise-books adapted to them and with a copious supply of Examples, are much needed and that there is a great and urgent want of Delectuses, Analecta, and generally of books of Selections from Authors, for use in Schools;—

That the Histories now read in Schools are greatly below present requirements, and in some cases there are absolute deficiencies; and that the want of good books on History is much felt in the Law and Modern History School in the University;—

That English Treatises on Physical Science, written with clearness and precision of language, and adapted for use in the higher classes of Schools, and in the Natural Science School of the University, do not exist.

They believe that the University may with propriety and efficiency do much towards remedying the defect. They have therefore determined to issue a series of Educational Works, hoping to supply some existing wants, and to help in improving methods of teaching.

The departments of Education which they propose to deal with at present are the following :—

- I. CLASSICS. The Delegates hope to issue
  1. Works suitable for the Universities and the highest forms of Schools; or
  2. Books for School-work generally, beginning from the very rudiments.
- II. MENTAL AND MORAL PHILOSOPHY.
- III. MATHEMATICAL WORKS; both for University Students, and also with especial regard to the needs of Middle Class Schools.
- IV. HISTORY. Here again there will be two classes of books :—
  1. Short Histories, such as may be useful for the History School, or for general reading ;
  2. School Histories, with all the necessary appliances for education.
- V. LAW.
- VI. PHYSICAL SCIENCE. The experience of teachers in the University and elsewhere has already pointed out several desirable works, and has also gone some way towards providing the books required.
- VII. ENGLISH LANGUAGE AND LITERATURE, which will comprise a carefully compiled series of Reading Books, Exercise Books, and Grammars.
- VIII. MODERN LANGUAGES.
- IX. A MISCELLANEOUS CLASS; including Handbooks on Art, Music, Literature, and the like.
- X. A SERIES OF ENGLISH CLASSICS.

*The DELEGATES OF THE PRESS invite suggestions and advice from all persons interested in sound education; and will be thankful for hints, &c., addressed to the Rev. G. W. KITCHIN, Walton Manor, Oxford.*

## Just Published.

- I. Chemistry for Students. By A. W. WILLIAMSON,  
Phil. Doc., F.R.S., Professor of Chemistry, University College,  
London. (Crown 8vo., cloth, price 7s. 6d.)

Also: Solutions of the Problems in "Chemistry for  
Students." By the same Author. (Sewed, price 6d.)

"Within less than four hundred pages of a handy little volume, in type not fatiguing to the eye, Professor Williamson here gives to the student an outline of the leading facts and principles of inorganic and organic chemistry.

"Very few men are able to compress, within such limits, so large a topic, and of those who should attempt to do so almost all would fail to keep together soul and body of the science. Even in large treatises there is a tendency to part principles from facts. Having taken the life out of the body in a few preliminary chapters, the learned expositor confines all further attention to the corpse. While this is true of many a large book, in a small book we get usually facts alone or principles alone, if not the two in a state of repulsion. Professor Williamson is accurately technical and so concise that at a glance his pages might seem to contain only the *caput mortuum* of a great science. But let a chapter be read, and the truth appears that the student who reads such a book as this is in the hands of a singularly skilful teacher who knows how, without waste of a word, to fix intelligent attention. Out of experiments and observed facts arranged in a clear logical order he develops principles, and points to the part they play in the world's life. Step by step the student is led, not blindfold but with his attention constantly directed to the landmarks on his way. For example, the book begins by telling the learner how to make oxygen. There is a diagram of the arrangement necessary, and a clear explanation of the process of getting the gas from chlorate of potash or manganese. Then there is an equally clear account (with a diagram) of Lavoisier's experiment for getting oxygen out of the common air. \* \* \* \* \*

"A volume constructed in this way is really a too rare example of what a good elementary text-book in any science ought to be: the language brief, simple, exact; the arrangement logical, developing in lucid order principles from facts, and keeping theory always dependent upon observation; a book that keeps the reason of the student active while he strives to master details difficult but never without interest, and that furnishes him with means for practising himself in the right management of each new tool of knowledge that is given to him for his use."—*Examiner*.

2. Greek Verbs, Irregular and Defective; their  
forms, meaning, and quantity; embracing all the Tenses used by  
Greek writers, with references to the passages in which they  
are found. By W. VEITCH. New and revised edition. (Crown  
8vo., cloth, 616 pp., price 8s. 6d.)

"The 'Clarendon Press Series' makes an excellent start, and if  
its succeeding volumes are to combine anything like the distinctive

merits of the first, it is destined to supersede every other series already in use. Mr. Veitch's work on the *Irregular and Defective Greek Verbs* is as signal a proof as could be furnished that a book designed to assist the learner or the advanced student may be convenient in size and yet exhaustive in treatment, may be quite original in investigation and yet fall readily into the educational channel, may confine itself to the strictest exposition of phenomena, and yet be fresh with the force of character and lively with the humour that belong more or less to all inquiring and independent minds.

\* \* \* \*

"We shall not pretend to review the treatise of an author who stands very nearly, if not altogether, alone in knowledge of his subject. Mr. Veitch is indeed as independent of the praise or the censure of critics as any author need care to be. It is one of his claims to the gratitude of scholars that, in spite of the premature and almost universal desertion of the field of rigid, textual scholarship, for the easier, showier, and pleasanter field of aesthetic or literary disquisition, he has persevered in his forsaken and solitary path, and has produced a work unique of its kind, full of fresh and lasting contributions to our knowledge of the Greek language, and intellectually vivacious and incisive on nearly every page. Open the book anywhere, and instances of erroneous doctrines corrected, of omissions (common to all our lexicons) supplemented, of new theories propounded and vindicated, occur at once. \* \* \* \* Let the critical reader compare Mr. Veitch's treatment of such a compound as *ἀνορθω*, for example, with its handling by other critics, and he will at once see how incomparably more trustworthy Mr. Veitch is as a guide not only for the pupil and teacher, not only for the writer of Greek prose and verse, but also for the constituter of texts and for the advanced amateur scholar. Indeed there is scarcely an authority, whether editor, lexicographer, or grammarian, British or Continental, whom Mr. Veitch has not occasion to correct, modify, or supplement. The German Dindorf, the Dutch Cobet, the French Littré, the English Liddell and Scott, are a few among living scholars who are repeatedly brought to the touchstone of comprehensive induction and acute judgment, while the dicta of departed authorities are canvassed with a freedom which would be almost cruel, were it not uniformly so just. We congratulate Mr. Veitch on the completion, and the Clarendon Press on the publication, of a work which will reinstate our scholarship in that esteem which the Germans have almost ceased to entertain for it since the days of Porson and Elmsley, and which will have the merit not only of purifying the fountain-heads of classical education, but of affording the youthful scholar an example of that moral singleness of purpose and undeviating search for truth which are even rarer than the intellectual gifts that have been lavished on its execution."—*Spectator*.

"The book before us by Mr. William Veitch is quite a wonderful contribution to critical knowledge of Greek, and has been selected by the Delegates of the Clarendon Press to lead off a new series of educational works. Its great distinction, in the first place, is that it is all derived from original reading. Mr. Veitch has not learned

the anatomy of the language from anybody's anatomical plates; he has dissected the body for himself. He has gone with a careful finger through the Greek texts, and the Greek texts in their latest recensions, marking every noticeable form, and checking by his own personal examination the *dicta* of other critics. \* \* \* The book is useful, indeed we may say indispensable, to scholars, in the widest sense of the word. It takes a larger range than its mere title would imply; and besides being a supplement to our best Lexicons, such as that of Liddell and Scott, contains touches of fine philology which would have delighted Porson and Elmsley. Indeed, the perusal of it recalls to our memory the description of Elmsley with which Hermann concluded his review of our countryman's edition of the *Medea*:—‘*Est enim P. Elmsleius, si quis alius, vir natus augendae accuratiori Graecae linguae cognitioni, ut ejus eximia ac plane singularis in pervestigandis rebus grammaticis diligentia regatur praeclaro ingenio, mente ab auctoritatibus libera, animo veri amantissimo, neque aut superbia, aut gloriae studio, aut obtrectandi cupiditate, praepedito.*’ It is a pleasant sign of the increased communication between the northern and southern parts of the United Kingdom that the Clarendon Press should have volunteered to bring this learned treatise before the world; and Mr. Veitch gratefully acknowledges the service in his preface. His book will soon become a text-book in all the great English public schools, and will doubtless by-and-by come to be known and appreciated also in the country in which it was written.”—*Pall Mall Gazette*.

### 3. An Elementary Treatise on Heat, with numerous Woodcuts and Diagrams. By BALFOUR STEWART, LL.D., F.R.S., Director of the Observatory at Kew. (Crown 8vo., cloth, price 7s. 6d.)

“In this work the Author endeavours to place before his readers in an elementary form the facts and principles of the Science of Heat, and also to give some of the most prominent practical applications of our knowledge of this subject. He begins with the study of well-ascertained facts, and proceeds onwards to general principles.

“The work is divided into three parts:—

“1. The study of the various Effects produced on Bodies by Heat. Many of the most recent investigations, and the apparatus used in conducting them, are described at length; and numerical examples are given to help the student to attain to the accuracy needful in physical researches.

“2. The Laws which regulate the Distribution of Heat through Space. This part includes radiation, conduction, convection, and the measurements of specific and latent heat. Theoretic views are here first introduced.

“3. The Nature of Heat, its Sources, and Connexion with other Properties of Matter. In this part heat is viewed as a species of motion; and the leading principles of the Science of Energy, by which heat becomes related to other forms of motion, are discussed.

"The work is chiefly intended for students of Physical Science ; but it is hoped that it may also interest general readers by placing before them some of the most remarkable and most practical and valuable truths arrived at by modern researches into the nature and qualities of heat."—*From the Author's Preface.*

#### 4. The Elements of Deductive Logic, designed

mainly for the use of Junior Students in the Universities. By the Rev. T. FOWLER, M.A., Fellow and Tutor of Lincoln College, Oxford. (Crown 8vo., cloth, price 3s. 6d.)

"The precise object of these pages is (without presupposing any technical acquaintance with logical terminology) to enable a student of average intelligence to acquire for himself an elementary knowledge of the main problems, principles, and rules of Deductive Logic."

\* \* \* \* \*

"The Manuals of Sanderson, Wallis, Aldrich, &c., owing to the peculiar circumstances of the period in which they were written—a period which, being transitional, retained not only much of the scholastic terminology, but also much of the Realistic doctrine—have ceased to be adapted to modern instruction. The Author, with some misgivings, and a keen sense of the difficulties of the task, trusts that the present work may be found usefully to occupy their place. Its propositions cannot however be presented in the same curt and dogmatic shape, for we have learnt to regard many portions of Logic, like many portions of the sciences whose method it claims to analyse, as fairly open to differences of opinion."

\* \* \* \* \*

"It is hoped that, independently of its bearing on University studies, a short English Manual of Logic may be used with advantage in the Upper Forms of Schools, and that it may not be without interest to the general reader."—*From the Author's Preface.*

#### 5. The Golden Treasury of Ancient Greek

Poetry ; being a Collection of the finest passages in the Greek Classic Poets, with Introductory Notices and Notes. By R. S. WRIGHT, M.A., Fellow of Oriel College, Oxford. (Crown 8vo., cloth, price 8s. 6d.)

The arguments in favour of selections from the ancient classics grow stronger as the time lessens which men can devote to the dead languages. Especially in the case of those ancients whose writings are rather of poetical or literary than of historical importance, such as the Greek poets, it seems better that students who cannot work through more than a few thousand lines, should give a part of their labour to detached passages of varied excellence, than that they should spend all their strength on whole works of which many parts are inferior in interest. Not all parts even of the best Greek poems are of equal beauty : the finest pieces are as good occasions for grammatical and critical instruction as those which are less fine ; and when the constructive art has been observed in a few whole works, there is much to be said in favour of a wider range and a less continuous but a more

extended and, so far, a more complete survey of the general poetical world of Greece.

Again a collection as well of the less known and accessible gems of Greek poetry as of more familiar passages from the greatest works may be of service to some even of those who no longer read Greek with a view to examinations.

No collection adapted to either of these purposes has yet been published : and the aim of this volume is to supply the want, by bringing together in a convenient form the finest passages of extant Greek verse from the *Iliad* to the later epigrammatists, so far as the limits of about seven thousand lines will allow.

A short statement of the subject of each passage is prefixed wherever such a statement appeared necessary to relieve the obscurity resulting from the absence of context ; and in some cases of unusual difficulty an analysis of the connexion of ideas is supplied in the margin. Historical introductions to the several poetical periods, addressed to the origin of each species of poetry and its connexion with the general history of the Greeks, and explanatory notes with occasional translations, are appended.

## 6. Specimens of Early English ; being a Series of

Extracts from the most important English Authors, Chronologically arranged, illustrative of the progress of the English Language and its Dialectic varieties, from A.D. 1250 to A.D. 1400. With Grammatical Introduction, Notes, and Glossary. By R. MORRIS, Esq., Editor of "The Story of Genesis and Exodus," &c. (Crown 8vo., cloth, price 7s. 6d) [Nearly ready.

This work seeks to set before students of the English language a systematic view of its older forms and their development, as exhibited in writers of the latter part of the thirteenth and the whole of the fourteenth centuries : a most important period in the history of our language, though it has been but imperfectly investigated even by the best writers on the subject. Existing text-books on the history of English literature and language not only pass over much that is important in this period, but they also deal in a very unsatisfactory way with many chief authorities, whose style, language, and position are thought to be sufficiently illustrated if twenty or thirty lines are devoted to them. There is in fact no real knowledge of this period to be met with. This present work is intended, partially at least, to fill this blank. It presents a series of specimens selected so as to form a connected and continuous whole. Each passage chosen is of considerable length (the extracts varying from 200 to upwards of 1200 lines) ; so that the grammar, vocabulary, and manner of each author are completely represented to the student.

These specimens are arranged in chronological order, and illustrate the leading *dialects* of the early English period. They will be found to be (for the most part) new ; having been chosen from works which have not usually been quoted and are not well known. In many cases the passages are re-edited from the best MSS. ; a few of them now appear for the first time.

The work has a grammatical Introduction, Notes, and a Glossary; and it is hoped that it may be within the reach and capacity of all who take an interest in the *origines* of our mother-tongue. It lays bare some of the strong foundations on which our language is built up; it throws some light on the ethnological and historical characteristics of its period; religion, manners, domestic habits, ranks and orders, of a very important time in the annals of this country are illustrated by it.

It is, however, specially intended for students in colleges in which the English language forms a part of the regular routine of instruction, and for candidates for the Civil and Indian Civil Service.

### In course of Preparation.

#### I. CLASSICS.

1. Sophocles. By the Rev. LEWIS CAMPBELL, M.A.,  
Professor of Greek at St. Andrews, late Fellow of Queen's  
College, Oxford.
2. Homer, Iliad I–XII. By D. B. MONRO, M.A.,  
Fellow of Oriel College, Oxford.
3. Homer, Odyssey I–XII.
4. ——— Odyssey XIII–XXIV. By ROBINSON ELLIS,  
M.A., Fellow of Trinity College, Oxford.
5. A Golden Treasury of Greek Prose, being a col-  
lection of the finest passages in the principal Greek Prose  
Writers, with Introductory Notices and Notes. By R. S.  
WRIGHT, M.A., Fellow of Oriel College, and J. E. L. SHADWELL,  
B.A., Student of Christ Church.
6. Horace. With English Notes and Introduction.  
By the Rev. E. WICKHAM, M.A., Fellow of New College,  
Oxford. Also a small Edition for Schools.
7. Livy I–X. By J. R. SEELEY, M.A., Fellow of  
Christ's College, Cambridge; Professor of Latin, University  
College, London. Also a small edition for Schools.
8. Cicero. Select Letters. By the Rev. A. WATSON,  
M.A., Fellow of Brasenose College, Oxford.
9. Cicero. The Philippic Orations. By the Rev. J. R.  
KING, M.A., Fellow of Merton College, Oxford.

10. Selections from the less known Latin Poets. By the Rev. NORTH PINDER, M.A., late Fellow of Trinity College, Oxford.
11. Selections from Xenophon (adapted for the use of Schools). With English Notes and Maps, by J. S. PHILLPOTTS, B.C.L., Fellow of New College, Oxford; Assistant Master in Rugby School.
12. The Commentaries of C. Jul. Caesar. Part I. The Gallic War, with English Notes, &c., by CHARLES E. MOBERLY, M.A., Assistant Master in Rugby School; late Scholar of Balliol. Also, to follow: Part II. The Civil War: by the same Editor.
13. Select Epistles of Cicero and Pliny (for Schools). With English Notes, by the Rev. C. E. PRICHARD, M.A., late Fellow of Balliol.
14. Selections from Plato (for Schools). With English Notes, by the Rev. B. JOWETT, M.A., Regius Professor of Greek, and J. PURVES, B.A., Balliol College.
15. The Elements of Greek Accentuation (for Schools): abridged from his larger work by H. W. CHANDLER, M.A., Fellow of Pembroke College, Oxford.
16. Cornelius Nepos (for Schools). With English Notes, by OSCAR BROWNING, M.A., Fellow of King's College, Cambridge, and Assistant Master at Eton College.

## II. MENTAL AND MORAL PHILOSOPHY.

1. The Elements of Deductive Logic, designed mainly for the use of Junior Students in the Universities. By the Rev. T. FOWLER, M.A., Fellow and Tutor of Lincoln College, Oxford. (Crown 8vo., cloth, price 3s. 6d.) [Ready.]

## III. MATHEMATICS.

1. An Elementary Treatise on Quaternions. By P. G. TAIT, M.A., Professor of Natural Philosophy in the University of Edinburgh; late Fellow of St. Peter's College, Cambridge. [In the Press.]
2. A Course of Lectures on Pure Geometry. By H. J. STEPHEN SMITH, M.A., F.R.S., Fellow of Balliol College, and Savilian Professor of Geometry in the University of Oxford.

## IV. HISTORY.

1. A History of Germany and of the Empire, down to the close of the Middle Ages. By J. BRYCE, M.A., Fellow of Oriel College, Oxford.
2. A History of British India. By S. OWEN, M.A., Lee's Reader in Law and History, Christ Church; and Reader in Indian Law in the University of Oxford.
3. A History of Greece. By E. A. FREEMAN, M.A., late Fellow of Trinity College, Oxford.
4. A Constitutional History of England. By the Rev. W. STUBBS, M.A., late Fellow of Trinity College, Oxford, and Regius Professor of Modern History.
5. A Church History of the First Three Centuries. By the Rev. W. W. SHIRLEY, D.D., Canon of Christ Church, and Professor of Ecclesiastical History.

## V. LAW.

1. The Institutes of Justinian, with Notes and an English Translation. By J. BRYCE, M.A., Fellow of Oriel College, Oxford.
2. Commentaries on Roman Law; from the original and the best modern sources. In Two Volumes, demy 8vo. By H. J. ROBY, M.A., formerly Fellow of St. John's College, Cambridge; Professor of Law at University College, London.

## VI. PHYSICAL SCIENCE.

1. A Treatise on Natural Philosophy. In four Volumes. By Sir W. THOMSON, LL.D., F.R.S., Professor of Natural Philosophy in the University of Glasgow, and P. G. TAIT, M.A., Professor of Natural Philosophy in the University of Edinburgh; late Fellow of St. Peter's College, Cambridge. *Vol. I. nearly ready.*
2. Also, by the same Authors, a smaller work on the same subject, forming a complete Introduction to the subject, so far as it can be explained by the help of Elementary Geometry and Algebra. *[In the Press.]*

3. **Forms of Animal Life.** Illustrated by Descriptions and Drawings of Dissections. By G. ROLLESTON, M.D., F.R.S., Linacre Professor of Physiology, Oxford. [*In the Press.*]
4. **On Laboratory Practice.** By A. VERNON HARCOURT, M.A., Lee's Reader in Chemistry at Christ Church, and H. G. MADAN, M.A., Fellow of Queen's College, Oxford.
5. **Geology.** By J. PHILLIPS, M.A., F.R.S., Professor of Geology, Oxford.
6. **Handbook of Astronomy, Descriptive and Practical.** With very numerous illustrations and tables. By G. F. CHAMBERS, F.R.A.S. [*In the Press.*]

## VII. ENGLISH LANGUAGE AND LITERATURE.

1. **On the Principles of Grammar.** By the Rev. E. THRING, M.A., Head Master of Uppingham School.  
Also, by the same Author, a *Gradual*, designed to serve as an Exercise and Composition Book in the English Language.
2. **The Philology of the English Tongue.** By the Rev. J. EARLE, M.A., late Fellow of Oriel College, Oxford, and late Professor of Anglo-Saxon.
3. **Reading Books.** *The First*, for Junior classes in Schools, in Two Vols. Vol. i. Prose. Vol. ii. Verse.  
*The Second*, for more advanced Readers, in Two Vols. Vol. i. Prose. Vol. ii. Verse. By the Author of "*Mademoiselle Mori.*"
4. **Typical Selections from the best English Authors** from the Sixteenth to the Nineteenth Century, (to serve as an higher Reading book,) with Introductory Notices and Notes, being a Contribution towards a History of English Literature.

## VIII. FRENCH.

By MONS. JULES BUE,

Honorary M. A. of Oxford ; Taylorian Teacher of French, Oxford ;  
Examiner in the Oxford Local Examinations from 1858.

1. **A French Grammar.** A complete theory of the French language, with the rules in French and English, and numerous Examples to serve as first Exercises in the language.

2. A French Grammar Test. A book of Exercises on French Grammar; each Exercise being preceded by Grammatical Questions.
3. Exercises in Translation No. 1, from French into English, with general rules on Translation; and containing Notes, Hints, and Cautions, founded on a comparison of the Grammar and Genius of the two languages.
4. Exercises in Translation No. 2, from English into French, on the same plan as the preceding book.
5. Exercises on French Idiomatic Locutions.
6. A new method of French Analysis.
7. Theory of French Pronunciation.

#### IX. MISCELLANEOUS.

1. The Principles of Music. By the Rev. Sir F. A. GORE OUSELEY, Bart., M.A., Mus. Doc., Professor of Music, Oxford.
2. A Handbook of Pictorial Art, with numerous Illustrations, and Practical Advice. By the Rev. R. ST. JOHN TYRWHITT, M.A., late Student and Tutor of Christ Church.

#### X. ENGLISH CLASSICS.

*Designed to meet the wants of Students in English Literature: under the superintendence of the Rev. J. S. Brewer, M.A., of Queen's College, Oxford, and Professor of English Literature at King's College, London.*

THERE are two dangers to which the student of English literature is exposed at the outset of his task;—his reading is apt to be too narrow or too diffuse.

Out of the vast number of authors set before him in books professing to deal with this subject he knows not which to

select: he thinks he must read a little of all; he soon abandons so hopeless an attempt; he ends by contenting himself with second-hand information; and professing to study English literature, he fails to master a single English author.

On the other hand, by confining his attention to one or two writers, or to one special period of English literature, the student narrows his view of it; he fails to grasp the subject as a whole; and in so doing misses one of the chief objects of his study.

How may these errors be avoided? How may minute reading be combined with comprehensiveness of view?

In the hope of furnishing an answer to these questions the Delegates of the Press, acting upon the advice and experience of Professor Brewer, have determined to issue a series of small volumes, which shall embrace, in a convenient form and at a low price, the general extent of English Literature, as represented in its masterpieces at successive epochs. It is thought that the student, by confining himself, in the first instance, to those authors who are most worthy of his attention, will be saved from the dangers of hasty and indiscriminate reading. By adopting the course thus marked out for him he will become familiar with the productions of the greatest minds in English Literature; and should he never be able to pursue the subject beyond the limits here prescribed, he will have laid the foundation of accurate habits of thought and judgment, which cannot fail of being serviceable to him hereafter.

The authors and works selected are such as will best serve to illustrate English literature in its *historical* aspect. As "the eye of history," without which history cannot be understood, the literature of a nation is the clearest and most intelligible record of its life. Its thoughts and its emotions, its graver and its less serious modes, its pro-

gress, or its degeneracy, are told by its best authors in their best words. This view of the subject will suggest the safest rules for the study of it.

With one exception all writers before the Reformation are excluded from the Series. However great may be the value of literature before that epoch, it is not completely national. For it had no common organ of language; it addressed itself to special classes; it dealt mainly with special subjects. Again; of writers who flourished after the Reformation, who were popular in their day, and reflected the manners and sentiments of their age, the larger part by far must be excluded from our list. Common sense tells us that if young persons, who have but a limited time at their disposal, read Marlowe or Greene, Burton, Hakewill or Du Bartas, Shakspeare, Bacon, and Milton will be comparatively neglected.

Keeping, then, to the best authors in each epoch—and here popular estimation is a safe guide—the student will find the following list of writers amply sufficient for his purpose: Chaucer, Spenser, Hooker, Shakspeare, Bacon, Milton, Dryden, Bunyan, Pope, Johnson, Burke, and Cowper. In other words, Chaucer is the exponent of the Middle Ages in England; Spenser of the Reformation and the Tudors; Hooker of the latter years of Elizabeth; Shakspeare and Bacon of the transition from Tudor to Stuart; Milton of Charles I and the Commonwealth; Dryden and Bunyan of the Restoration; Pope of Anne and the House of Hanover; Johnson, Burke, and Cowper of the reign of George III to the close of the last century.

The list could be easily enlarged; the names of Jeremy Taylor, Clarendon, Hobbes, Locke, Swift, Addison, Goldsmith, and others are omitted. But in so wide a field, the difficulty is to keep the series from becoming unwieldy, without diminishing its comprehensiveness. Hereafter, should

the plan prove to be useful, some of the masterpieces of the authors just mentioned may be added to the list.

The task of selection is not yet finished. For purposes of education, it would neither be possible, nor, if possible, desirable, to place in the hands of students the whole of the works of the authors we have chosen. We must set before them only the masterpieces of literature, and their studies must be directed, not only to the greatest minds, but to their choicest productions. These are to be read again and again, separately and in combination. Their purport, form, language, bearing on the times, must be minutely studied, till the student begins to recognise the full value of each work both in itself and in its relations to those that go before and those that follow it.

It is especially hoped that this Series may prove useful to Ladies' Schools and Middle Class Schools; in which English Literature must always be a leading subject of instruction.

**A General Introduction to the Series. By the Rev. PROFESSOR BREWER, M.A.**

1. Chaucer. *The Prologue to the Canterbury Tales; the Knight's Tale; the Nun's Priest's Tale.* Edited by R. MORRIS, Esq., Editor for the Early English Text Society, &c. &c.
2. Spenser. *Faerie Queene, Book I., with the Poet's letter to Sir Walter Raleigh.* Edited by the Rev. G. W. KITCHIN, M.A., formerly Censor of Christ Church.
3. Hooker. *Ecclesiastical Polity, Book I.* Edited by the Rev. R. W. CHURCH, M.A., Rector of Whatley; formerly Fellow of Oriel College.
4. Shakspeare. *The English Historical Plays; the five Great Tragedies; Julius Caesar; and The Tempest.* Edited by the Rev. W. G. CLARK, M.A., Fellow of Trinity College, Cambridge, and Public Orator; and J. ALDIS WRIGHT, M.A., Fellow of Trinity College, Cambridge.

expressed by the copula 'is not.' These remarks may appear inconsistent with the form of the second example, but 'no rectilineal figure is &c.' is really an abbreviated and unambiguous mode of stating the longer and ambiguous proposition 'All rectilineal figures are not, &c.'

The word 'predicated,' as equivalent to 'asserted or denied,' is here used in a wider than its ordinary signification. In common language, we say such and such an attribute cannot be predicated of such and such a term, using 'predicated' as equivalent to 'asserted' and as opposed to 'denied.' All ambiguity may be avoided by speaking of the predicate as predicated affirmatively or predicated negatively of the subject.

## CHAPTER II.

### *On the Copula.*

THE Logical Copula, it being its office simply to serve as a sign of predication, is limited to the present tense of the verb 'to be,' with or without the addition of the negative particle, according as the proposition is negative or affirmative. This follows from the fact that it is simply the office of the proposition to express my present judgment as to the compatibility or incompatibility of two terms. Hence all reference to time, past or future, and even to time present, as respects the terms themselves, and not my judgment as to their compatibility, must be expressed in the predicate and not in the copula. I may, for brevity's sake, say 'fire burns,' 'Alexander was the son of Philip,' 'The guns will be fired to-morrow,' and, in practical discussion, it would undoubtedly be pedantic to express these propositions otherwise; but formally, for the purpose of being estimated logically, I must resolve them into their logical elements, and say 'Fire *is* burning,' 'Alexander *is* a person who was son of Philip,' 'The firing of the guns *is* an event which will take place to-morrow.'

Not only does the logical copula convey no notion of

time with reference to the terms themselves (or, to speak more accurately, the things signified by them), but it is also divested of the notion of existence. In other words, it is employed *simply* as a connecting particle, not as a substantive verb. Where the substantive verb is used in a logical proposition, it must be expressed in the predicate. Thus 'I am,' 'The king is not,' become 'I *am* existent,' 'The king *is* non-existent.' That the copula implies no notion of existence is evident from the fact that we can use such propositions as these: 'The labours of Hercules are a myth,' 'He is a nonentity.'

Can we modify the copula so as to express certainty, probability, possibility, or other modes of connection between the subject and predicate? This is the celebrated question of Modality, and has given occasion to much dispute amongst logicians. Even though it were granted that the proposition simply expresses our present judgment on the compatibility or incompatibility of two terms, it might be maintained that it should express the nature of our judgment and the degree of our assent or dissent, whether it be certain, approximating to certainty, or faltering. Thus it might be maintained that the following should be accepted as instances of the ultimate analysis of a logical proposition: 'This *is certainly* the man I saw yesterday,' 'This *is probably* the man I saw yesterday,' 'This *is possibly* the man I saw yesterday.' That we use these forms in conversation and discussion is unquestionable, but it is one main object of Logic to analyse our abbreviated inferences and statements

into their full logical equivalents. Instead therefore of admitting various descriptions of copulæ (other than the affirmative and negative), in order to conform Logic to ordinary language, it seems simpler, as well as more scientific, to insist on the uniform character of the copula, and to represent propositions like the foregoing as predicating our degree of assent to or dissent from the sentence in question. Thus, after asking myself the question 'Is *this* the man I saw yesterday?', I may either answer simply 'This *is* the man I saw yesterday,' or I may describe the degree of my assent by stating 'That this is the man I saw yesterday *is* certain, probable, possible,' &c. In fact, such propositions seem to be the result of an act of reflection on the degree of our own conviction.

We shall therefore regard the form A *is* or *is not* B as the ultimate and uniform logical analysis of all propositions, though we shall occasionally, for the sake of brevity, avail ourselves of the forms sanctioned by popular language.

## CHAPTER III.

### *Division of Propositions according to their Quantity and Quality.*

WE have already seen that propositions are either *affirmative* or *negative*, according as the copula used is of the form 'is' or 'is not.' This is called a division of propositions according to their *Quality*.

They are further divided, according to their *Quantity*, into *Universal* and *Particular*. For, in affirming or denying a predicate of a subject, it is obvious that I may either affirm or deny the predicate of all the individuals denoted by the subject, or of part only. Thus in affirming mortality of man, I may say 'All men are mortal,' or 'Some men are mortal;' in denying wisdom of man, I may deny it of all men or only of some men, i.e. I may say 'No men are wise,' or 'Some men are not wise.' When the predicate is affirmed or denied of all the individuals denoted by the subject, the proposition is called an Universal Proposition; when of part only, a Particular Proposition. A Singular Proposition, i.e. a proposition of which the subject is a singular term, ranks as an Universal, because the predicate is affirmed or denied of everything (i.e. in this

case, the one thing) denoted by the subject. The same holds good of a proposition in which the subject is a collective term. An attributive, as we have already seen, cannot, by itself, be used as the subject of a proposition. Abstract terms which have come to be used as common terms, and admit of plurals, as figure, triangle, virtue, pleasure, &c., have a denotative power, and may, like common terms, form the subjects of either universal or particular propositions. But those abstract terms, like humanity, wisdom, &c., which retain their original characteristic of being connotative only, and admit of no plurals, simply express an attribute or group of attributes with which, as a whole, it is asserted or denied that the predicate is compatible; consequently, a proposition, of which such a term is the subject, ranks as an universal.

Thus such propositions as 'Ambition is aggressive,' 'Wisdom is a virtue,' 'The fourteenth legion is disbanded,' 'Socrates is an Athenian citizen,' are, on the very face of them, universals. But propositions in which the subject is a common term or an abstract term, used as a common term, must be *quantified*; that is, we must attach to the subject either an universal or a particular designation. It is not sufficient to say, 'triangles are figures,' 'horses are black;' we must state whether we mean that 'all triangles' or 'some triangles' are 'figures,' whether we mean that 'all horses' or 'some horses' are black. 'Indefinite' or 'indesignate' propositions, as they are called, i. e. propositions in which the subject, being

a common term, is not quantified, are inadmissible in Logic.

By combining the division of propositions into universal and particular with that into affirmative and negative we obtain four forms, viz. —

Universal Affirmative.	All X is Y.	(A)
Universal Negative.	No X is Y.	(E)
Particular Affirmative.	Some X is Y.	(I)
Particular Negative.	Some X is not Y.	(O)

We shall in future designate these forms of proposition respectively as A, E, I, O<sup>1</sup>.

*Note.* — Sir W. Hamilton, followed by several other logicians, maintains that *in thought* the predicate is always quantified as well as the subject. He proposes to reform the logical theory of the proposition accord-

<sup>1</sup> It sometimes requires a little ingenuity to state a given proposition in one of the above forms. Thus the propositions 'None but the brave deserve the fair,' 'The wise alone are good,' 'Not every historian is worthy of credit,' 'All his acts are not defensible,' when stated in strictly logical form, become respectively, No not-brave (or None who are not brave) are deserving of the fair, No not-wise (or None who are not wise) are good, Some historians *are not* worthy of credit, Some of his acts *are not* defensible. The simplest equivalents of the two former propositions are, All who deserve the fair are brave, All good men are wise, but these are gained by permutation and conversion, two forms of inference which have not yet been explained.

ingly, and in lieu of the four ordinary forms of proposition substitutes the following :—

All X is all Y.

All X is some Y.

Any X is not any Y.

Any X is not some Y.

Some X is all Y.

Some X is some Y.

Some X is not any Y.

Some X is not some Y.

This scheme, if adopted, would, as Sir W. Hamilton shews, reduce all conversion to simple conversion, render nugatory any discussion as to the distribution of terms, and considerably simplify the forms of syllogism : see the Appendices to Sir W. Hamilton's *Discussions*, and to his *Lectures on Logic*. Amongst other criticisms may be seen Mr. Mill's in his *Examination of Hamilton's Philosophy*, ch. xxii. It would of course be undesirable to enter here into any discussion as to the merits of Sir W. Hamilton's theory, but, as reasons for not adopting the quantification of the predicate in the present work, it may be sufficient to state (1) that, as to utility, the trouble entailed by quantifying the predicate in every proposition would probably far exceed that saved by simplifying the forms of Conversion and Syllogism ; (2) that the forms of expression given above are not merely unusual, but are such as we never do use, whereas, though the analysis of our thoughts frequently leads to

forms of expression which are unusual, this would, if admitted, be the only case in which it led to forms which never are used ; (3) that some of the above propositions really contain in a compressed form two ordinary propositions, as e.g. 'All A is all B' contains the two ordinary propositions 'All A is B' and 'All B is A,' the proposition 'Some A is all B' contains the two ordinary propositions 'Some A is B' and 'All B is A,' whereas it is the object of Logic not to state our thoughts in a condensed form but to analyse them into their simplest elements.

## CHAPTER IV.

### *Distribution of Terms.*

A TERM is said to be *distributed*, when it is employed in its entire extent, i. e. when it applies to all the individuals denoted by the name. Thus, when we say, 'all men,' 'no men,' 'man' is distributed; when we say 'some men,' it is undistributed. This phraseology of course applies directly only to common terms, but singular and collective terms, as has already been explained, must always be taken in an universal acceptation, i. e. they are always distributed. The same is true of those abstract terms which have not come to be used as common terms, because they, as it were, personify the attribute or group of attributes which they express; when used in a proposition, they have, in fact, the characteristics of singular terms. In such propositions as, 'This is wisdom,' 'Wisdom is justified of her children,' 'Warmth is essential to growth,' 'Knowledge is power,' there can be no doubt that the abstract terms are distributed precisely as if they were singular terms, and that, for all logical purposes, these propositions rank as universal. Attributives, i. e. adjectives and participles, have no meaning except in connection with a substantive. They must either be prefixed to a sub-

men are animals,' or 'Some Englishmen are poets,' I do not include in the group 'man' all animals, nor in the group 'Englishmen' all poets. It may of course happen that the predicate in an A or I proposition is co-extensive with the subject, as in the propositions 'All men are rational animals,' 'Some men are poets,' but this is accidental, and is not implied in the form of the proposition.

From these two rules we infer that, in the case of common terms and attributives, an A proposition distributes its subject only, E both its subject and predicate, I neither, O its predicate only. If a term be singular, collective, or abstract, it is invariably distributed.

things' and 'red things,' and thus, through the medium of the common terms, become denotative.

## CHAPTER V.

### *Relation of the Predicate to the Subject of a Proposition (Heads of Predicables).*

FROM what has already been said, it is plain that a singular, collective, or abstract term, inasmuch as it is always distributed, cannot form the subject of an I or O proposition; on a little reflection it will also be plain that the predicate of a proposition cannot be singular, collective, or abstract, unless the subject be the same. We have already noticed that an attributive can never form the subject of any proposition. These considerations will be found to simplify the problem before us.

This problem may be stated thus: How may the predicates of propositions be classified in relation to their subjects? or What are the heads of predicables (prædicabilia, things or words that may be predicated)? We shall discuss the four forms of proposition in order.

To commence with A, and with the special case where both subject and predicate are common terms, or abstract terms which are used as common terms<sup>1</sup>. Here

<sup>1</sup> It may perhaps assist the student in following what, to be exhaustive, must necessarily be a tedious disquisition, if we afford him some clue to the order in which the cases will be discussed:—

---

the predicate may either be equivalent in extent to the subject, or greater; it cannot be less. We can say, for instance, 'All men are animals,' or 'All men are rational animals,' but we cannot say 'All animals are men.' Now, if the predicate be equivalent in extent to the subject, it is either a *Synonym* as 'A wold is a down,' or a *Definition* as 'A triangle is a three-sided rectilineal figure,' or a combination of a *genus* (a term which will be immediately explained) with some attribute which is peculiar to the term in question (called by Aristotle an *ἰδιον* or 'peculiarity') as 'A triangle is a rectilineal figure the sum of whose angles is equal to two right angles.' A synonym, it need hardly be stated, is an equivalent word, and a definition is an exposition of the connotation of a term. Now it will be observed that the definition of a triangle consists of two parts, one in which it is designated as 'a rectilineal figure'—a wider group, which includes not only triangles but other rectilineal figures—and the other part an attributive, 'three-sided,' which distinguishes triangles from all other groups contained in the wider group to which triangle has been referred. The former part of the definition is called the *genus*, and with reference to it

In the A proposition, if the predicate be a common term, the subject may be ( $\alpha$ ) a common, ( $\beta$ ) a singular or collective term; if the predicate be a singular or collective term, the subject must be the same. If the predicate be an abstract term, the subject must be the same; and if the predicate be an attributive, the subject may be ( $\alpha$ ) a common, ( $\beta$ ) a singular or collective, ( $\gamma$ ) an abstract term. The discussion of the cases in I, E, and O is much less elaborate

'triangles,' the group of figures defined, is called a *species*; the latter part of the definition, 'three-sided,' which distinguishes triangles from squares, pentagons, and other rectilinear figures which are designated by the wider term, is called the *differentia* or 'differencing' attribute. It is obvious that there might be more than one of these, and then they would be called the *differentiæ*. With reference to the third case, 'A triangle is a rectilinear figure the sum of whose angles is equal to two right angles,' 'rectilinear figure' is, as before, to be regarded as a genus, but the attributive 'having the sum of its angles equal to two right angles' cannot be regarded as a *differentia*, for it is not connoted by the term 'triangle,' but requires to be proved of it; at the same time it is an attribute *peculiar* to the triangle, and hence, retaining the Aristotelian term, we may call it an *ἰδιον*. Lastly, there remains the case in which the predicate is of greater extent than the subject, both being common terms, as in the propositions 'All men are animals,' 'All triangles are figures.' Here the subject denotes a smaller group of individuals included under the wider group designated by the predicate; that is, according to the terminology already explained, the predicate is related to the subject as *genus* to *species*.

When the predicate is a common term, and the subject a singular or collective term, as in the instances 'Socrates is a philosopher,' 'Socrates is an Athenian citizen,' 'The House of Commons is a branch of the legislature,' the predicate is related to the subject as a

group of individuals to an individual, i.e. as a *species* to an individual, for the word 'genus' is only applicable to a group containing other groups. The same account must be given of those propositions in which the predicate is an abstract term employed as a common term, and the subject is an abstract term which does not admit of a plural, as e.g. 'Temperance is a virtue.' 'Heat is a mode of motion.'

When the predicate is a singular or collective term, the subject must, as we have already seen, be a similar term. Moreover the predicate in these propositions is always distributed as well as the subject, and consequently the two terms are co-extensive. But, inasmuch as singular and collective terms have, at least directly, no connotation, the predicate cannot stand to the subject in the relation of a definition, or of an *ἰδιον*<sup>2</sup> (i.e. a peculiar attribute) combined with a genus. It can only be a synonym, or a singular or collective term designating the individual or the collective group. As instances of these propositions we may give the following: 'Cephas is Peter,' 'Socrates is the son of Sophroniscus,' 'This is the man whom I saw yesterday, and whom I told to come to me,' 'The fourteenth legion is the legion quartered in Britain.' When the predicate is not a synonym, it may perhaps be called a Designation.

When the predicate is an abstract term, the subject must be abstract as well, and, as in the case of singular

<sup>2</sup> There is no English word which exactly corresponds to this expression.

and collective terms, the subject and predicate are both distributed, and consequently are of equal extent. We take as instances of the various forms which propositions of this kind may assume, 'Charity is love,' 'Honesty is the best policy,' 'Definition is the exposition of the connotation of a term.' Now in the first example 'love' is intended as a synonym of 'charity,' in the second 'the best policy' is predicated of 'honesty' as distinguishing it from all other courses of conduct; the third example is an ordinary case of a definition. The case of two abstract terms may therefore be regarded as identical, so far as concerns the relation of the predicate to the subject, with that of two common terms which are co-extensive.

Lastly, there remains the case in which the predicate is an attributive. Supposing the subject to be a common term, the predicate may, as we have seen, be a *differentia*, as in the proposition 'All triangles are three-sided,' or an *ιδιον*, as in the proposition 'All triangles have the sum of their angles equal to two right angles.' Or, though neither a *differentia* nor an *ιδιον*, it may be what, along with the *ιδιον*, modern logicians would call a *Property*, viz. an attribute which, though not connoted by the subject nor even peculiar to it, follows from something connoted by the subject either as effect from cause or as conclusion from premiss. An instance of a property which follows from the connotation of the subject *by demonstration* would be given in the proposition 'A parallelogram has its opposite sides equal' or in the proposition 'A circle is a figure the ratio of whose

circumference to its diameter is approximately 3.14159 : 1.' As instances of propositions in which the predicate expresses a property following from the connotation of the subject by *causation*, we may give 'Men are capable of combining for purposes of joint action,' 'Water communicates pressure equally in all directions.' The first property follows from rationality, or that combined with the power of articulate speech, which seems to be connoted by the very word man; the second property follows from the fluidity of water. The last example of a property following by way of demonstration and the first of a property following by way of causation are *ἰδιαι* in the sense of Aristotle, as well as *propria* in the sense of the later logicians. There is one other case, that in which the attributive, though neither connoted by the subject nor following from anything connoted by the subject, is predicable of everything denoted by it. Such an attributive is called an *Inseparable Accident*, and the common instance given by logicians is the proposition 'All crows are black.' If the blackness of crows could be connected by way of causation with any attribute connoted by the name, it would be regarded as a property; if, on the other hand, a crow could be found which was not black, blackness would be degraded to the rank of a Separable Accident, a term which will be explained below.

We have thus far considered attributives as predicates in the special case where the subject is a common term. Where the subject is a singular or collective term, and consequently has no direct connotation, the attributive in

the predicate can only be an inseparable accident<sup>3</sup>. I may indeed say 'Socrates is rational,' but I predicate rationality of him as man, not as Socrates. Where the subject is an abstract term, the attributive in the predicate may be a *differentia* or a property, but cannot be an inseparable accident, for there are no individuals which the abstract term in the subject denotes.

In the I proposition, we are not concerned with singular, collective, or abstract terms. If the predicate be a common term, it may be related to the common term in the subject either as *species* to genus, or as species to species, as e.g. 'Some men are poets,' or 'Some poets are philosophers.' The latter relation is that of two groups, which have some members in common—overlapping species, as they have been called. The relation may also be that of *genus* to species, as 'Some men are animals,' 'Some poets are men,' but this form of proposition is unnatural, and is practically useless, as it stops at a particular assertion when an universal is legitimate. If the predicate be an attributive, it must, unless the proposition

<sup>3</sup> Sometimes a distinction is drawn between the separable and inseparable accidents of an individual. An inseparable accident of an individual is regarded as one which is predicable of it at all times, a separable accident as predicable only at certain times. Thus in the propositions, 'John is tall,' 'John is sitting down,' 'tall' is regarded as an inseparable, 'sitting down' as a separable accident. But the expressions separable and inseparable accident are here employed in an entirely different sense from that in which they have been employed above, and it seems preferable to regard all attributes which are predicated of individuals, in their individual character, as inseparable accidents—inseparable, that is to say, from the individual under the circumstances in which it is at present placed.

te less than the truth, be a separable accident, i. e. an attribute which is true only of some of the individuals denoted by the subject, as e.g. 'Some men are black,' 'Some triangles are equilateral.'

With regard to negative propositions, it is not necessary to speak at any length. The negation of an attributive in an E proposition implies that it is neither a differentia, property, nor accident; in an O proposition that it is neither a differentia, property, nor inseparable accident, though it may be a separable accident. All that has been said of the relations of singular, collective, and abstract terms, as subjects, either to similar terms or to common terms and attributives, as predicates, in the case of an A proposition, holds good also, *mutatis mutandis*, of similar relations in E. It may perhaps be as well to give a few instances of such propositions: 'Socrates *is not* a poet,' 'Socrates *is not* the man I saw yesterday,' 'The fourteenth legion *is not* engaged in the battle,' 'Charity *is not* obtrusive,' 'Ambition *is not* a virtue.' Where a common term is denied of a singular or collective term, it stands to the subject in the relation of species to individual. Where a common term is denied of a common term, there is nothing to prevent the terms being most remote from each other and hardly admitting of comparison; but here the most appropriate relation is—in an E proposition, that of cognate though exclusive species, i. e. of species which having many characteristics in common, and both falling immediately under the same genus, still denote no individuals in common,—in an O proposition, that of

overlapping species. Thus we should be far more likely to derive information from such propositions as these, 'No sandstone is limestone,' 'Some astronomers are not mathematicians,' than from such propositions as these, 'No men are trees,' 'Some stones are not vipers.'

From what has been said we have derived the following names for the predicate in its relation to the subject: synonym, definition, designation, genus, species, differentia, ἰδιον, property (not being an ἰδιον), inseparable accident, separable accident. Of these, logicians have neglected synonym and designation, the former probably on account of its unimportance, the latter perhaps because it applies only to singular and collective terms. Definition is analysed into genus and differentia; no distinction is drawn by later logicians between ἰδια and those properties which are not peculiar to the subject, both being alike designated by the word 'property;' and the word 'accident' serves alike for separable and inseparable accident. Genus, difference, species, property, and accident, are known as the five heads of predicables.

These may be briefly defined as follows:—

A *Genus* is a term expressive of a wider group of individuals including narrower groups.

A *Species*, in reference to a genus, is a term expressive of a narrower group included in the genus; in reference to an individual, of a group including it. Both genus and species are designated by common terms, or by abstract terms which are used as common terms.

A *Differentia* is an attributive which expresses part of the connotation of the subject, and which distinguishes the subject from all other species which fall under the same genus.

A *Property* is an attributive which does not express any part of the connotation of the subject, but which follows from some part of the connotation of the subject, either as an effect from a cause, or as a conclusion from premisses.

An *Accident* is an attributive which may be predicated of the whole or part of the individuals denoted by a common term, or which may be predicated of an individual, but which is neither connoted by the common term nor to be inferred from anything which is connoted thereby.

---

*Note 1.*—Contrary to the practice of most logicians, we have discussed the heads of predicables under the second part of Logic. In doing this, we have attempted to restore to them their original significance in the works of Aristotle, as a classification of the predicates in their relation to the subjects of propositions. It is perhaps needless to add that we have not followed implicitly the Aristotelian account, or in all cases adopted the Aristotelian phraseology. By Porphyry, the schoolmen, and their successors of the seventeenth and eighteenth centuries, the heads of predicables were regarded as a classification of universals in their relations to one another, rather than with reference to their place in a proposition, and consequently, from the time that Logic was divided into

parts, were discussed under the first part. Definition and division, as dependent on a knowledge of genus, species, and differentia, are also here treated under the second part of Logic, though they are ordinarily discussed under the first.

*Note 2.*—On the vexed, and somewhat subtle, question of the Import of Propositions, or, as it is sometimes called the Theory of Predication, the student may be referred to Hobbes' *Computation or Logic*, ch. iii, Mr. Mill's *Logic* bk. i. ch. 5, Mr. Mansel's *Prolegomena Logica*, ch. ii, and W. Hamilton's *Lectures on Logic*, Lects. viii. and xiii, and Mr. Mill's *Examination of Sir W. Hamilton's Philosophy* ch. xviii. The view we should adopt may be briefly summarized as follows: wherever the predicate is a singular or collective term, or, though a common or abstract term, a synonym of the subject, the theory of Hobbes, that the predicate is a name of the same thing of which the subject is a name, furnishes a sufficient account; in all other cases, Hobbes' theory is true though insufficient, for, where the predicate is an attributive or an abstract term (not being a synonym), the predicate also asserts or denies certain attributes of the subject, and where it is a common term (not being a synonym), not only are certain attributes asserted or denied of the subject, but the latter is referred to or excluded from the group of individuals denoted by the predicate. From this it will be seen that we do not agree with Mr. Mill in regarding all predication (except when the predicate is a singular or collective term) as predication merely of attributes.

## CHAPTER VI.

### *On Verbal and Real Propositions.*

**AFFIRMATIVE** propositions in which the subject is a common or abstract term may be divided into Verbal and Real. A verbal proposition expresses merely the connotation or part of the connotation of the term, a real proposition expresses either solely, or in conjunction with part of the connotation of the term, properties, accidents, or both. Thus a verbal proposition simply states what might be gathered from a due consideration of the name, as 'All men are rational,' 'All triangles are three-sided,' whereas a real proposition imparts knowledge which could not be gathered from the name alone, as 'All triangles have the sum of their angles equal to two right angles,' 'Some men are black.'

---

*Note.*—The distinction between verbal and real propositions is otherwise expressed by that between Analytical and Synthetical judgments (Kant), Explicative and Ampliative judgments (Sir W. Hamilton and Abp. Thomson), Essential and Accidental propositions (the schoolmen). Tautologous propositions (All A is A), and propositions in which the predicate is a synonym of the subject (as e.g. 'Charity is love'), should be referred to the head of verbal propositions.

## CHAPTER VII.

### *On Definition.*

A DEFINITION may always be represented as a proposition, of which the term defined forms the subject<sup>1</sup>. It is its object to expound the connotation or intensive capacity of a term, i.e. to state the attributes which the term implies.

From this it is plain that singular and collective terms, inasmuch as they do not in themselves connote any attributes, are incapable of definition. They may, however, be *described* by means of the various common terms which are predicable of them, as well as by designations which are peculiar to themselves. Thus I may say 'John is a tall man of fair complexion, is by profession a London solicitor, and occupies such and such a house in Bedford-row.' This may be called a *Description of a Singular or Collective Term*, in order to distinguish it from the Description of a common term, which is noticed below, and which we shall call simply Description. Besides singular and collective terms, a term expressing a single attribute, which is incapable of analysis into other attributes, is incapable of definition. Thus it has been maintained that it is useless to attempt to define such terms as pleasure, pain, colour, thing, attribute, &c.

<sup>1</sup> It is indifferent whether we speak of the entire proposition as the definition, or merely the explication which forms the predicate; similarly in the case of a description.

In defining a term, it would of course be impossible, in every case, to state the definition in terms expressive of attributes which were themselves incapable of analysis, even if we were agreed as to what are terms of this character. The terms employed in the definition may therefore express groups of attributes, provided that, when taken together, they exhaust the connotation of the term defined. Thus each of the words 'rational' and 'animal' expresses a large group of attributes, but if, when taken together, they exhaust the connotation of the word 'man,' the definition may be accepted as legitimate.

In seeking to define a term, I invariably contrast it with some other term; often, when I imagine it to be difficult to exhaust the connotation, with a variety of other terms, from which I seek to distinguish it. Thus in seeking to define 'monarchy,' I contrast it with other forms of government; in seeking to define 'triangle,' I contrast it not only with other rectilineal figures but with spherical triangles; in seeking to define 'light,' I contrast it with heat, sound, electricity, and other impalpable powers of nature. Now that portion of the definition which is common to the term defined and to the other terms with which it has been compared is called the *genus*, the term defined standing to it in the relation of a species, as has already been explained; that portion which distinguishes the term defined from the terms with which it has been compared is called the *differentia*, or sometimes, when there is more than one distinguishing

attribute, the *differentia*<sup>2</sup>. Thus, if we were distinguishing rectilinear triangle from spherical triangle, 'three-sided figure' would be the genus; if from other rectilinear figures, the genus would be 'rectilinear figure;' if from both spherical triangles and other rectilinear figures, the genus would be simply 'figure.' It will be observed that the genus is always expressed in the form of a common term, or of an abstract term which is used as a common term, and that it may be qualified by an attributive. This is the case even in defining abstract terms, as e. g. in the definitions, 'Justice is a virtue which respects our relations to other men in society,' 'Temperance is a virtue which respects the control of our own desires,' the genus is 'a virtue,' an abstract term which has come to be used as a common term.

A Definition being an exposition of the meaning of a term, it is obvious that all definitions must be limited by the state of our knowledge at the time when we frame them. But some terms have been expressly framed or have been appropriated to express a small number of attributes. Such terms are monarchy, anarchy, triangle, square, school, monastery, &c. Our accepted definitions of these we may be quite sure we shall not be compelled to alter with advancing knowledge, providing at least that the words continue to denote the same objects. But however full and adequate to our

<sup>2</sup> Some logicians simply use the word 'differentia' for the purpose of expressing the distinguishing attributes, whether one or many; others, as Aristotle, would in the latter case speak of the 'differentiæ.'

present state of knowledge our definitions of man, animal, vegetable, light, heat, &c., might be at the present time, they might, two hundred years hence, become most inadequate and incomplete, if not incorrect, even although the terms continued to denote the same objects or sensations. We might, for instance, discover the mode of transmission of light, or that the animal world was not separated from the vegetable by the same characteristics by which we now conceive it to be, and henceforth these discoveries would become part of the connotation of the words, or would materially alter the connotation. In the greater number of cases, therefore, we must be content to regard our definitions as provisional<sup>3</sup>.

But not only must we in most cases be content with provisional definitions; we must often be content with definitions which, measured even by our present state of knowledge, are incomplete. It would often be most inconvenient, when it is required simply to distinguish between two terms, to give the full connotation of each. In such cases, therefore, it is regarded as practically sufficient, if we refer the terms contrasted to their common genus and specify a sufficient number of attributes to distinguish each from the other. Thus in the often-quoted example of definition, 'Man is a rational animal,'

<sup>3</sup> It would be a service to logicians if there were recognised names by which to distinguish between these two different classes of definitions, viz. the definitions of terms whose connotation is limited, and whose definitions are therefore final, and the definitions of terms whose connotation is unlimited, and whose definitions are therefore provisional.

it would be absurd to suppose that 'rational' and 'animal' exhaust the connotation of 'man,' but the word 'rational' is sufficient roughly to distinguish the human race from the lower animals with which it is generally contrasted. When these *incomplete definitions*, as they are called (i. e. definitions which do not give the complete connotation of a term), are once admitted, it is obvious that our definitions of the same term may vary indefinitely according to the particular point of view from which we make them, or the science which we happen to be pursuing at the time.

An exposition of a term which gives no part of its connotation, but in lieu of it an enumeration of properties and accidents, is called a *Description*. Thus 'Man is a featherless biped<sup>4</sup>' would be regarded as a description, not as a definition of man. But the term 'description' is also extended to those cases in which properties and accidents are combined with a portion of the connotation, the latter being usually stated as the genus. Thus we might describe horse as an animal which is domesticated, which has a mane and a tail, which has a high value attached to it, which is to be found in Arabia and Europe, &c., &c.; or we may take as an instance of a description Cuvier's definition

<sup>4</sup> Here the attributive 'biped,' being used as a quasi-genus (i. e. a property or accident which, for a special purpose, is employed as a genus), is stated in the form of a substantive. This particular example of a description is, of course, absurd, and simply serves the purpose of roughly distinguishing men from birds.

of man, as a mammiferous animal having two hands. The latter instance is sufficient to shew that a description may often serve the purpose of distinguishing the term defined from all other terms, and may therefore be quite adequate to fulfil the purposes of a definition for any special object.

From what has been said it will be seen that definitions may be classified as follows:—

- (1) Complete and final.
- (2) Complete (so far as we know), but provisional.
- (3) Incomplete, but sufficient to distinguish the term defined from all other terms.
- (4) Incomplete, but sufficient to distinguish the term defined for the special purpose in hand.
- (5) A description only, but sufficient to distinguish the term defined from all other terms.
- (6) A description only, but sufficient to distinguish the term defined for the special purpose in hand.

Any pretended definition or description which does not fulfil one of these conditions must be rejected as having no value whatever. In testing a definition, we should at once reject it if it were applicable to any other term, unless we were expressly told that it was used only for the purposes of a particular science, and we found on investigation that it was distinguishable from all other terms employed in that science. Thus, in a discussion on politics, it would be sufficient to define monarchy as the supreme government of one man, but, if speaking generally, I must add 'in a state,' for one man may be

supreme governor in his family, in a school, in a religious association, &c.

---

*Note 1.*—It may have occurred to the student to ask ‘How are we to distinguish those attributes, which form part of the connotation of a term, from the attributes which are inferred from them?’ This is a question which in many individual cases it would be extremely difficult to answer, and there might be great differences of opinion as to what attributes were to be regarded as *differentiæ*, and what as properties. It is in fact the same question as ‘What are the primary, and what are the derived qualities of an object?’. The only general answer that can be given is that, wherever one attribute or quality can be inferred from another, it is to be regarded as a derived quality of the object or a logical property, and that all those attributes that cannot be so derived are to be regarded provisionally as an assemblage of primary qualities or, in logical language, the connotation of the term. As our knowledge advances, it is of course possible that many of these primary qualities may be resolved into secondary, i.e. many of the supposed *differentiæ* may be resolved into properties.

*Note 2.*—The scholastic logicians distinguished between real and nominal definitions, meaning by a real definition the explication of the nature of a thing, by a nominal definition the explication of the meaning of a term. The first would give an answer to such a question as ‘What

*is man?*’, the second to such a question as ‘What do *we mean* by the term *man*?’ As the meaning we attach to a term exactly corresponds with our knowledge of the primary or underived attributes of the thing, this distinction is now regarded as nugatory. Mr. Mill has however revived the expressions ‘real’ and ‘nominal’ definition to mark a distinction, already noticed by Aristotle, between those definitions which define a term expressive of a really existent object and those which define a term to which there is no really existent object corresponding. Thus the definition of a ‘horse’ would be called a real definition, that of a ‘centaur’ a nominal definition.

*Note 3.*—Sometimes we may explain a term by a synonym, an etymology, or a translation, which may accidentally be better known to the hearer or reader than the term so explained. These cannot be accepted as definitions in our sense of the word, inasmuch as they do not analyse the connotation of the term; but they would have been regarded as instances of nominal definitions by the older logicians.

## CHAPTER VIII.

### *On Divisions and Classifications.*

A DIVISION may always be represented as a proposition, of which the term divided forms the subject. It is its object to expound the denotation or extensive capacity of a term. This object it effects by enumerating, not the individuals (which would in most cases be impossible), but the smaller groups which the term denotes. The terms denoting these smaller groups are called the *dividing members* (*membra dividenda*) in contra-distinction to the *divided term* (called by the older logicians the 'divided whole,' *totum divisum*).

It is plain that common terms, or abstract terms which are employed as such, are alone capable of being divided. Abstract terms and attributives have, in themselves, no denotation, while singular and collective terms are incapable of being divided into smaller groups. A collective term may however easily be transformed into a common term, and so rendered capable of being divided; thus 'the fourteenth regiment' may become 'soldiers of the fourteenth regiment,' and in this form may be divided into officers and privates, or other groups. The same remark holds good of abstract terms and attributives.

It may be laid down as a test of a logical division that

the term divided must be predicable of each dividing member. Thus 'figure' is predicable alike of triangle, square, &c., 'man' of white man and black man. In this manner it is distinguished from a *partition* of a physical whole into its parts, as of 'man' into head, arms, legs, &c., or of the 'world' into Europe, Asia, Africa, and America. But this test, though sufficient to distinguish a division from a partition, is not sufficient to distinguish it from two other forms of proposition, which nevertheless we must beware of confounding with it. These are an *enumeration* of individuals, and a *distinction* of an equivocal term according to its various meanings, as e. g. of 'humanity,' according as it means human nature, the human race collectively, the virtue of being humane, or the study of polite letters. In a distinction the same definition is not predicable of each of the terms distinguished, but in a division the same definition is predicable of each dividing member.

In dividing a term into terms expressive of smaller groups (or, as they are frequently called, subject-classes), I invariably try to think of some attribute which is predicable of certain members of the group, but not of others. This attribute suggests what is called the *fundamentum divisionis* or *principle of division* (i. e. some characteristic of the group, which is a source of differences amongst its members). Thus, if asked to divide 'triangles,' it may first occur to me that some triangles have equal sides and others not; in this case the characteristic of a triangle that the lengths of its sides

may be variously related, or, in other words, the relation of the sides, becomes the *fundamentum divisionis*, and I divide triangles into equilateral, isosceles, and scalene. Or it may first occur to me that some triangles are right-angled, and others not; in this case the measure of the angles becomes the *fundamentum divisionis*, and I divide triangles into right-angled, obtuse-angled, and acute-angled. Or, to take one more instance, if asked to divide 'governments,' I may reflect that in some governments the sovereignty is divided, in others it is placed entirely in the hands of one person or order, and I may divide 'governments' accordingly into pure and mixed, proceeding to divide pure governments, according to the number of persons in whose hands the sovereignty is placed, into monarchies, oligarchies, and democracies. Any division in which two or more *fundamenta divisionis* are confounded is called a *cross-division* and is logically inadmissible. Thus a division of triangles into isosceles, scalene, and right-angled, or of governments into monarchies, free governments, and mixed governments, or of men into Frenchmen, Asiatics, the unproductive classes, and barbarians, would be a cross-division. In the last example there is a confusion of no less than four *fundamenta divisionis*.

It is maintained by many logicians, and with justice that in every legitimate division (or, at least, in every division which we have sufficient reason for knowing to be legitimate), the process by which the division is arrived at, if strictly analysed, may be described as follows:

Taking, for instance, 'triangles,' we reflect, say, that some are equilateral; we then divide triangles into equilateral and those which are not equilateral, and again, still thinking of equality of sides, those which are not equilateral into those which have two sides equal (isosceles), and those which have none (scalene). Similarly, taking 'men,' and thinking of race as our fundamentum divisionis, we divide mankind into Aryans and those who are not Aryans, the latter into Semites and those who are not, the latter into Turanians and those who are not, and so on, till our division is complete. This process, when formally drawn out, is called *Division by Dichotomy*, and the rule by which it proceeds is in each division to take two terms which admit no medium between them. Thus such pairs of terms as productive and unproductive, fallible and infallible, white and not white, would answer the purpose.

The divided term stands of course to the dividing members as a genus to species. We can also gather the differentia from the fundamentum divisionis. Thus, in dividing a term, we virtually define the subject terms. A pure government, for instance, may be defined as a government in which the sovereignty is undivided, and a mixed government as a government in which the sovereignty is divided. In defining also we virtually divide. Thus the definition of man as a rational animal implies a division of animals into men and brutes, and the definition of triangle as a three-sided rectilineal figure implies a division of rectilineal figures into three-

sided and not three-sided (i.e. quadrilaterals and polygons).

The rules for a legitimate division may, in accordance with what has already been said, be stated as follows:

1. Each dividing member must be a common term, or an abstract term which is used as a common term.

2. The divided term must be predicable of each dividing member.

3. The division must be exhaustive, i.e. the dividing members, when taken together, must be equal in extent to the term divided.

4. The division must always be made according to one fundamentum divisionis only. The use of more than one will produce a cross-division.

It is not necessary to add the rule that the dividing members must be 'mutually exclusive,' as this is already provided for by Rule 4. This rule however often affords a good test for discovering a cross-division. If I find that two dividing members denote some individuals in common, it shews at once that there must be at least two fundamenta divisionis. The student may easily frame for himself examples of illegitimate divisions. If we were absurdly to divide Europeans into Celts, Teutons, Slaves, Frenchmen, Spaniards, the Emperor of Russia, and the President of the United States of America, we should have an example of all the faults incident to a division.

In speaking of division by dichotomy we have already introduced the notion of sub-division. For scientific accuracy, and often even for practical purposes, it may be necessary to sub-divide the dividing members, again to sub-divide the results of this sub-division, and so on. The relation of these various divisions and sub-divisions, one to another, has given rise to several logical terms, and is of sufficient importance in itself to require a brief treatment. It is best to commence with an example, and we select a mathematical one, as being of the simplest kind :—

In a series of divisions and sub-divisions like the foregoing, the term at the head of the series (in this case Figure) is called the *Summum Genus*. The terms at the bottom of the series (equilateral triangles, circles, &c.) are called *Infimæ Species*. The intermediate terms are called *Subaltern Genera*, or *Subaltern Species*, viz. subaltern genera with reference to the terms immediately below them, and subaltern species with reference to the terms immediately above them. Thus triangle would be a subaltern genus with reference to equilateral triangle, a subaltern species with reference to rectilinear figure. Species which fall immediately under the same genus, as e.g. triangle, quadrilateral, and polygon, are called *Cognate*

*Species.* A *Cognate Genus* is any one of the ascending genera under which the species falls. Thus triangle, rectilinear figure, figure, are all genera cognate to equilateral triangle. A differentia which *constitutes*, as is said, an infima species is called a *Specific Difference*, one which constitutes a subaltern species a *Generic Difference*. Thus 'equilateral' is a specific difference, 'three-sided' a generic difference of an equilateral triangle. Or 'three-sided' would be regarded as a specific difference, and 'rectilinear' a generic difference of a triangle. Lastly, a property which is derived from an attribute or attributes connoted by a summum or subaltern genus is called a *Generic Property*; a property derived from an attribute or attributes connoted by an infima species is called a *Specific Property*. It is, for instance, a property of all rectilinear figures that the sum of their angles is equal to twice as many right angles as the figure has sides, *minus* four right angles. Thus the angles of a triangle are together equal to two right angles, those of a quadrilateral to four, those of a pentagon to six, and so on. It is also a property of a triangle that it may be generated by the section of a cone, but this is not a property common to other rectilinear figures. Hence the latter would be called a specific, the former a generic property.

The instance we have given is one of the simplest that could be selected. If we had taken instead of it, say, the division of animals into vertebrate and invertebrate, of vertebrate animals into birds, reptiles, fishes, amphibia, and mammals, of mammals into the various species of men,

orses, oxen, &c., it would have required a long scientific dictionary to distinguish the various species and genera, to state the specific and generic differences, and to give instances of specific and generic properties. And yet it is exactly in such a case as this that divisions and sub-divisions (or, in one word, Classifications) are most important. In fact, the sciences of Botany and Zoology (in the vulgar acceptation of these words) consist entirely of classifications. To give rules for so important and complicated a process as scientific classification, or even to attempt any precise definition of the word, would be to go beyond the scope of an elementary work like this. It may be sufficient to suggest that where, as in the case of plants and animals, species are separated from one another by an indefinite number of attributes, and may be separated by many attributes of which we are yet ignorant, our classifications, like our definitions, should always be regarded as provisional. To this we may add two plain rules, which meet with universal acceptance: first, that our classifications should proceed as gradually as possible; and second, that we should select as principles of division attributes the most fruitful in their consequences, i.e. attributes from which the largest number of important properties can be derived. Thus the natural system of Botany, founded, in its main division, on differences in the seed-vessels of plants, is far more instructive than the Linnæan system, founded on differences in the numbers of the pistils and stamens.

---

## PART III.—OF INFERENCES.

### CHAPTER I.

#### *On the various kinds of Inferences.*

THE third and most important part of Logic treats of Inferences<sup>1</sup>. Wherever we assert a proposition in consequence of one or more other propositions, or, in other words, wherever we regard one or more propositions as justifying us in asserting a proposition distinct from any that has preceded, the combination of propositions may be regarded as an inference. Thus defined, inferences may be divided into inductive and deductive, and

<sup>1</sup> The word 'inference' is employed in no less than three different senses. It is sometimes used to express the conclusion in conjunction with the premiss or premisses from which it is derived, as when we speak of a syllogism or an induction as an inference, sometimes it is used to express the conclusion alone, sometimes the process by which the conclusion is derived from the premisses, as when we speak of Induction or Deduction as inferences or inferential processes. Except where the meaning is obvious from the context, we shall endeavour to confine the word to the first-named signification. The terms *Induction* and *Deduction* will be appropriated to express *processes* which result, the former in *inductions* or *inductive inferences*, the latter in *deductions* or *deductive inferences*, these being subdivided into *syllogism* and *immediate inferences*.

deductive inferences may be sub-divided into mediate and immediate. We shall attempt to make these distinctions clear by examples.

I mix tartaric acid and carbonate of soda in certain proportions in water, and I observe that the mixture is followed by an effervescence; from this I *infer* that, whenever tartaric acid and carbonate of soda are mixed in water in these proportions, effervescence will follow. I put a poker into the fire, and I observe that after a time it becomes red-hot; from this I *infer* that incandescence can always be produced in iron by a certain degree of heat. I observe five points in the orbit of a planet, and, from my knowledge of mathematics, perceive that they are situated in an ellipse; from this I *infer* that the entire orbit of the planet is elliptical, and that, in all future revolutions of the planet, a similar orbit will be described. Now what in these cases do I mean by the word 'infer'? That the mixture is *followed* by effervescence is a matter of observation; but it is only an inferential process which justifies me in asserting that, inasmuch as it could have been produced by nothing else, the effervescence was *produced* by the mixture, and that, whenever in future I see a similar mixture, I may expect to see it followed by similar results. Two assumptions, it will be seen, underlie this inference; 1st, that everything has a cause, which leads me to assume that the effervescence must have been produced by something or other; 2nd, the belief in the uniformity of nature, which leads me to expect that, whenever similar circumstances are repeated, they will

be followed by similar results. The reasoning therefore in these cases may be represented as follows :—

The mixture of the tartaric acid with the carbonate of soda is *followed* by effervescence. (Original Proposition.)

- ∴ (Owing to the special circumstances of the case and in conformity with the principle that everything must have a cause), the effervescence was *produced* by the mixture.
- ∴ (In conformity with the principle of the uniformity of nature), a similar mixture will always be followed by an effervescence.

We may represent the reasoning in the third example in the same manner :—

We may assert (by virtue of our knowledge of mathematics) that five points which we have observed in the orbit of the planet Mars are situated in the arc of an ellipse. (Original Proposition.)

- ∴ As there are, comparatively speaking, no forces acting upon the planet except the tangential force and the attraction of the sun, we may infer that the fact of the five points observed being in the arc of an ellipse is due to the combined action of these forces.
- ∴ (In conformity with the principle of the uniformity of nature), it may be inferred that all other points in the orbit of the planet are situated in an

ellipse, and that, in all future revolutions, a similar orbit will be described ; i. e. the orbit of the planet Mars may be regarded as elliptical.

Now inferences of this kind are called *Inductive*. The instances we have selected are remarkably simple, but they are sufficient to shew that an induction may be defined as an inference in which we argue from particulars to adjacent particulars, or (if we speak of the adjacent particulars collectively) from particulars to universals, in conformity with the laws of universal causation and of the uniformity of nature. As to the circumstances which justify us in asserting that one phenomenon or set of phenomena is the cause or the effect of, or is invariably conjoined with, another (for this is the problem of Induction), the student is referred to such works as those of Mr. Mill and Dr. Whewell. It is sufficient here to distinguish inductive from the deductive inferences which it is our more special business to explain <sup>2</sup>.

<sup>2</sup> An *Analogy* is an imperfect induction, and bears the same relation to an induction which probable arguments bear to ordinary syllogisms. If two objects resemble each other in several important respects, and we argue that any particular attribute which we know to be predicable of the one, and do not know to be either predicable or not predicable of the other, is, on account of the general resemblance of the two objects, also predicable of the other, the argument is called an argument from analogy ; and, in the same way, if two objects are dissimilar, we may argue that an attribute which is predicable of the one, is, on account of their dissimilarity, not predicable of the other. Thus, from the similarity between the earth and the moon, we might argue that the latter is inhabited, or, from their dissimilarity, that it is not inhabited. The value of the inference always depends on the ratio of the ascertained resemblances to the ascertained differences

Beginning where induction ended, we may state such a proposition as this : 'All iron when heated to a certain degree, becomes red-hot.' This, if combined with another proposition 'This is a piece of iron,' leads to the conclusion 'This piece of iron, if heated to a certain degree, will become red-hot.' Now it is plain that the conclusion we have just drawn was arrived at in an entirely different manner from those noticed above. Instead of being the conclusion of an inference in which we argue from particulars to adjacent particulars or from particulars

(it being understood that the resemblances which we take into account are none of them derived, as properties, from each other, and so with the differences), providing that our knowledge of the objects is sufficiently large to justify us in drawing any inference at all. For a more detailed analysis of this mode of reasoning, and an estimate of the value to be attached to its conclusions, the student is referred to Mr. Mill's *Logic*, bk. iii. ch. xx, one of the most instructive and important chapters in his work.

It should be noticed that an analogy, as here described, corresponds to the Example of Aristotle, an analogy being, according to his nomenclature, an equality of relations (*ισότης λόγων*). Thus the expression,

The intellect : the soul = the eye : the body,

is an *ἀναλογία*. From this it is argued that any special relation which subsists between the one pair of terms subsists also between the other. (Or, to take a non-Aristotelian instance, which will be more intelligible to beginners :

A colony : the mother-country = a child : a parent.

From this it is argued that the reciprocal rights and duties of a colony and the mother-state are identical with those of a child and a parent.) An argument from analogy, in this sense, it will be seen, is only a special case of the Aristotelian Example, or of analogy, in the sense in which the term is now usually employed.

The Fallacy of False Analogy will be noticed below.

to universals (i. e. from cases which are within the range of our observation to others which are without), it is simply a combination of two propositions into one, being gathered entirely from what has been previously stated in the premisses. Induction has been not inaptly compared to the establishing of a formula, Deduction (for that is the appropriate name of the process which we are now discussing) to the reading it off. Induction leads to truths entirely new, Deduction combines, methodizes, and develops those which we have already gained.

A Syllogism may be called a Mediate Inference, because the two terms of the conclusion are compared in the premisses by means of a third. It is thus opposed to an Immediate Inference, which consists of two propositions only, and in which the inferred proposition is derived from a single proposition without the aid of any other term or proposition, expressed or implied. Both mediate and immediate inferences may be styled deductive as opposed to inductive.

This division may easily be shewn to be exhaustive. In any inference, we argue either to something already implied in the premisses or not; if the latter, the inference is inductive, if the former, deductive. If the deductive inference contain only a single premiss, it is immediate, if it contain two premisses and the conclusion be drawn from these jointly, it is mediate and is called a syllogism. All deductive inferences which apparently contain more premisses than two admit of being analysed into a series of syllogisms.

*Note 1.*—We are here departing from the ordinary scheme of division adopted by logicians. Inferences are generally divided into mediate and immediate, and mediate inferences are subdivided into inductive and deductive. As however we regard inductions as more strongly contrasted with both syllogisms and immediate inferences than either of these classes is with the other, it seems preferable to make inductions one of the main members, rather than one of the subordinate members of the division. Nor is there any reason why an immediate inference should not be regarded as deductive.

It should also be noticed that Sir W. Hamilton would deny the title of inferences to inductions (as they have been here explained), whereas Mr. Mill would deny that either a syllogism or an immediate inference can properly be called an inference. Mr. Mill maintains that all Inference is “from the known to the unknown;” Sir W. Hamilton defines Inference as “the carrying out into the last proposition what was virtually contained in the antecedent judgments.”

*Note 2.*—The Aristotelian induction, in which the conclusion affirms or denies of a group what was in the premisses affirmed or denied of each member of the group severally, is, according to the above method of treatment, obviously regarded as a deductive inference. If I predicate some quality of each member of a group, and thence infer that all members of the group possess this quality, the conclusion is plainly contained in the

premisses, and the inference is a syllogism. It may be represented in the form <sup>3</sup>—

x, y, z are B.

The individuals constituting the group A are x, y, z.

∴ The individuals constituting the group A are B.

Such an inference is altogether different from what we now understand by an induction. On this subject the student may with advantage read Mr. Mill's chapter on "Inductions improperly so called." See Mill's *Logic*, bk. iii. ch. 2. An account of the Aristotelian induction will be found in Appendix G to Mr. Mansel's Edition of *Aldrich*; in Sir W. Hamilton's *Essay on Logic*, and in his *Lectures on Logic*, Lect. xvii. and Appendix vii. These authors, as already noticed in the case of Sir W. Hamilton, regard inductions, in the modern sense of the word, as extra-logical. The advanced student may also consult with advantage Mr. De Morgan's chapter on "Induction," *Formal Logic*, ch. xi.

<sup>3</sup> By Aristotle himself the inductive inference is analysed thus:—

x, y, z are B,

x, y, z are (i. e. constitute) A;

∴ A is B.

The minor premiss, when stated in so peculiar a form, of course admits of simple conversion, and thus assumes the form given in the text.

## CHAPTER II.

### *On Immediate Inferences.*

§ 1. AN Immediate Inference may be formally defined as a combination of two propositions of which one is inferred from the other, the proposition inferred being virtually included in the proposition from which it is inferred. Of Immediate Inferences the most important forms are Oppositions, Conversions, Permutations<sup>1</sup>.

#### § 2. *On Oppositions.*

Two propositions are said to be *opposed* when they have the same subject and predicate, but differ in quantity or quality or both. An Opposition may be defined as an immediate inference in which from the truth or falsity of one proposition we infer either the truth or falsity of another, this proposition having the same subject and predicate as the former, but differing in quantity or quality or both. Thus from the proposition 'That all X is Y is true' we may infer the proposition 'That no X is Y is false,' or 'That some X is Y is true,' or 'That some X is not Y is false.'

<sup>1</sup> It is the more common practice to speak of Opposition, Conversion, and Permutation, but we have adopted the plural number in order to draw attention to the fact that Logic is concerned with the results rather than with the processes by which they are arrived at.

The opposition between

A and E is called a Contrary Opposition.

I and O, a Subcontrary Opposition.

A and I, or E and O, a Subaltern Opposition.

A and O, or E and I, a Contradictory Opposition.

These forms of opposition are exhibited in the annexe scheme :—

If A be true ; E is false, I true, O false.

If A be false ; E is unknown, I unknown, O true.

If E be true ; A is false, I false, O true.

If E be false ; A is unknown, I true, O unknown.

If I be true ; A is unknown, E false, O unknown.

If I be false ; A is false, E true, O true.

If O be true ; A is false, E unknown, I unknown.

If O be false ; A is true, E false, I true.

It will be observed that it is only in a Contradictory Opposition (where the opposed terms differ both in quantity and quality) that from the truth or falsity of one proposition we can invariably infer the truth or falsity of another, the conclusion which we draw in this case being from the truth or falsity of the

one proposition to the falsity or truth respectively of the other. Hence logicians have called contradictory the most perfect form of opposition. It is a rule of practical Logic that a contradictory should always in disputations be used in preference to a contrary opposition; for it serves equally well the purpose of contradicting an opponent, and the particular proposition which it asserts affords less ground for attack than an universal. Thus, if my opponent asserts A (as e.g. All philosophers are unimagi-native), I may meet his assertion by the contradictory O (Some philosophers, as e.g. Plato, Goethe, &c., are not unimagi-native), and from this position I cannot well be dislodged. But suppose I assert in opposition to him an E proposition (No philosophers are unimagi-native), he will probably be able to adduce instances of some philosophers who, according to the ordinary meaning of the word 'imagi-native,' would be called unimagi-native, and so, by meeting my E with an I proposition, gain an apparent victory. As a fact, we should each have made assertions too wide, but he would have succeeded in dislodging me from my position, whereas (owing to my neglect of the laws of contradiction) I should not have succeeded in dislodging him from his.

---

*Note.*—It is plain that, according to the ordinary meaning of the word 'opposition,' it is somewhat of an abuse of language to speak of A and I, or E and O propositions as being opposed. It would be better

if this form of inference were called Subalternation or Subordination.

Nor, strictly speaking, can the relation between I and O be called one of opposition, for they may both be true together. Accordingly, Aristotle says that in reality (*κατ' ἀλήθειαν*) there are three forms of opposition (those between A and E, A and O, E and O), though in language (*κατὰ τὴν λέξιν*) there are four (adding that between I and O). What is called a Subaltern Opposition he does not recognise.

### § 3. *On Conversions.*

A proposition is said to be *converted* when its terms are transposed, so that the subject becomes the predicate, and the predicate the subject. A Conversion may be defined as an immediate inference in which from one proposition we infer another having the same terms as the original proposition, but their order reversed. This inference in some cases necessitates a change of quantity in passing from one proposition to the other, and then it is called a *Conversion per accidens*; when it necessitates no such change, it is called a *Simple Conversion*<sup>2</sup>.

I and E may both be converted simply. Thus, from 'Some X is Y,' or 'Some poets are philosophers,' I may infer 'Some Y is X,' or 'Some philosophers are poets.' From 'No X is Y,' or 'No savages are trustworthy,' I may infer 'No Y is X,' or 'No trustworthy persons are savages.'

<sup>2</sup> It is proposed by Sir W. Hamilton to call the original proposition the "Convertend," the inferred proposition the "Converse."

A can only be converted *per accidens*. For though it may sometimes happen that the subject and predicate of an A proposition are co-extensive, and therefore convertible, this is not implied in the form of the proposition, and it is with what is implied in the form of the proposition that we are alone concerned. Thus, if I assert the proposition 'All triangles are three-sided rectilinear figures,' it happens in this particular case that I am justified, without any change of quantity, in stating the converse, 'All three-sided rectilinear figures are triangles.' But if I state that 'All triangles are rectilinear figures,' I am only justified in inferring that 'Some rectilinear figures are triangles.' As, therefore, the general form of an A proposition does not imply the simple convertibility of the subject and predicate, I am only justified in inferring from 'All X is Y,' that 'Some Y is X.'

An O proposition cannot be converted at all. From 'Some X is not Y,' it does not follow that 'Some Y is not X,' for Y may stand to X in the relation of a species to a genus. Thus from the proposition 'Some Europeans are not Frenchmen,' I cannot infer that 'Some Frenchmen are not Europeans.'

#### § 4. *On Permutations*<sup>3</sup>.

A Permutation may be defined as an immediate Inference in which from one proposition we infer

<sup>3</sup> The term Permutation is borrowed from Mr. Karlake's *Aids to Logic*. The same inference is sometimes called Infinitation, from the Nomen Infinitum, or, more properly, Nomen Indefinitum (not -Y, as the contradictory of Y), which is employed as the predicate.

another differing in quality, and having, therefore, inst of the original predicate its contradictory. Thus :—

From All X is Y, we may infer that No X is not-Y.

From No X is Y, . . . . All X is not-Y.

From Some X is Y, . . . . Some X is not not-Y

From Some X is not Y, . . . . Some X is not-Y.

The legitimacy of these inferences is apparent from the fact that contradictory terms (A and not-A) admit of a medium, so that, if I predicate the one affirmatively, I may always predicate the other negatively, and vice versa.

The O proposition, when permuted from ‘Some X not Y,’ into ‘Some X is not-Y,’ may of course be converted into ‘Some not-Y is X.’ This combination of permutation and conversion is improperly described by Whately and many previous logicians as a single inference, and styled “Conversion by Contra-Position or Negation.

It may assist the student if we add some further instances of permutations :—

All men are fallible,  $\therefore$  No men are infallible.

No men are infallible,  $\therefore$  All men are fallible.

Some poets are reflective,  $\therefore$  Some poets are not unreflective.

Some poets are not unreflective,  $\therefore$  Some poets are reflective.

All poets are men of genius,  $\therefore$  (by permutation) No poets are not-men-of-genius;  $\therefore$  (by conversion) No not-men-of-genius (= None but men of genius) are poets.

*Note.*—We have here employed an expression ‘Contradictory Terms,’ which in most works on Logic is explained in the first part, as included under the doctrine of Opposition of Terms. It seemed, however, desirable to introduce only those distinctions of terms which were likely to be frequently required in the sequel of the work. We may here state that ‘Contradictory Terms,’ such as white and not-white, lawful and un-lawful, are terms which admit of no medium, i. e. terms which are not both predicable of the same thing, and one or other of which must be predicable. ‘Contrary Terms,’ like good and bad, black and white, are terms which are most opposed under the same genus; they are not both predicable of the same thing, but it is not necessary that one or other of them should be predicable.

## CHAPTER III.

### *On Mediate Inference or Syllogism.*

#### § 1. *The Structure of the Syllogism.*

A SYLLOGISM may be defined as a combination of two propositions, necessitating a third in virtue of the mutual connection; or as an inference in which a third proposition is inferred from two others conjointly, the third proposition being virtually contained in the two propositions from which it is inferred. This is obviously a definition of a legitimate syllogism. There may (as will appear below) be apparent syllogisms, which do not fulfil the conditions of this definition. We may give the following as instances of syllogisms:—

- (1) All B is A,  
All C is B;  
∴ All C is A.
- (2) All sovereign powers are invested with  
supreme authority over their subjects,  
All republics are sovereign powers;  
∴ All republics are invested with supreme authority over their subjects.

- (3) No rectilinear figure is bounded by one line,  
 A circle is bounded by one line;  
 ∴ A circle is not a rectilinear figure.

The proposition inferred is called *the Conclusion*, the propositions from which it is inferred *the Premisses*, either of them singly being called *a Premiss*.

As the conclusion is virtually contained in the premisses conjointly, it is plain that the two terms of the conclusion must occur in the premisses, one in either. If both terms occurred in the same premiss, the other premiss would be entirely alien to the conclusion. The remaining term of each premiss must be the same; else there would be nothing in common between the two premisses, and the conclusion could not be said to be *inferred* from the two conjointly. This third term, with which the two terms of the conclusion may be regarded as compared, is called the *middle term*. The predicate of the conclusion is called the *major term*, and the subject the *minor term*; the premiss, in which the major and middle terms are compared, is called the *major premiss*, and should always be stated first; that in which the minor and middle terms are compared is called the *minor premiss*. Thus in a syllogism, formally stated, there are always three propositions including three terms, the premisses occurring first and the conclusion last. But practically, in reasoning, we frequently state the conclusion first, introducing one or both premisses with such a word as 'for' or 'because,' as stating our reason for the assertion. Thus I may say 'I will not go out to-day, for it is raining,'

or, 'I will not go out to-day for it is raining, and the rain may give me a cold.' When stated in this form, the conclusion is called by the older logicians the *Problema* or *Quæstio*, being regarded as a question to which the reason or reasons assigned furnish the answer. It will also have occurred to the student that, as a fact, we usually state only one premiss, leaving the other (which may be either the major or minor) to be understood. Thus, instead of stating Syllogism (2) formally, as above, I should in an actual discussion say, 'A republic is invested with supreme authority over its subjects, for every sovereign power is invested with such authority,' or, 'A republic is, &c., for it is a sovereign power,' or briefly, 'A republic (being a sovereign power) is invested,' &c.; or, the premiss coming first, 'Inasmuch as every sovereign power is invested, &c., I maintain a republic to be invested with that authority,' or, 'Inasmuch as a republic is a sovereign power, it is invested with,' &c.<sup>1</sup> Instead of suppressing one of the premisses, I may, for brevity's sake, suppress the conclusion. Thus I may say 'Every sovereign power is invested with supreme authority over its subjects, and a republic is a sovereign power,' leaving it to the hearer or reader to draw the conclusion for himself. The syllogism does not pretend to be the form, or even a form, in which our reasonings are usually stated, but simply one of the ultimate analyses of them.

<sup>1</sup> A syllogism with a suppressed premiss is by Aldrich wrongly identified with the Enthymeme of Aristotle. Such a syllogism was called by the Stoics a *συλλογισμὸς μονολήμματος*.

As every term in the syllogism occurs twice, it should be noticed that, on both occasions, it should be used in the same sense, or, to adopt technical language, every term in the syllogism should be used *univocally*. If we use a term *equivocally*, i. e. in two entirely different senses, or even *analogously*, i. e. in two different senses having some relation to each other, it is plain that, logically speaking, we are using two different terms, and consequently the syllogism will include four terms instead of three. This caution includes the rule usually given by logicians against an *ambiguous middle*. The neglect of it, palpable as it might be supposed to be, is often, especially in a long course of reasoning, very difficult of detection, and is a fertile source of fallacy. We may adduce as very simple instances :—

Humanity is a moral virtue,  
 The study of polite letters is humanity ;  
 ∴ The study of polite letters is a moral virtue.

The church is the aggregate of all Christian people,  
 This particular congregation (or particular building) is the church (meaning at some particular place);  
 ∴ This particular congregation (or particular building) is the aggregate of all Christian people.

In the former case, the term ‘humanity’ has come to be used in such widely different senses, that it may be regarded as used equivocally; in the latter case, the senses

of the word 'church' are perhaps sufficiently nearly allied to be regarded as analogous. All cases of what are termed 'Verbal Fallacies' may be referred to this head.

---

*Note.* The words 'major,' 'minor,' and 'middle,' as applied to the terms in a syllogism, have been inherited by all subsequent logicians from the nomenclature of Aristotle. He regarded what we shall presently call the First Figure (B is or is not A, C is B,  $\therefore$  C is or is not A) as the perfect type of syllogism, and, amongst other modes, stated it in the form C is in B ( $\tau\omicron\ \Gamma\ \acute{\epsilon}\sigma\tau\acute{\iota}\nu\ \acute{\epsilon}\nu\ \delta\lambda\omega\ \tau\hat{\omega}\ B$ ), B is or is not in A,  $\therefore$  C is or is not in A. Thus stated, C appears to be the smallest, B the intermediate, and A the largest term in extent. See *Prior Analytics*, bk. i. ch. 4. In negative propositions, however, we have no means of determining the relative extent of the subject and predicate, and consequently Aristotle's nomenclature does not properly apply to negative syllogisms. To affirmative syllogisms in the first figure, whether universal or particular, it applies only in a modified shape, for the propositions, All X is Y, Some X is Y, though they imply that Y cannot be less in logical extent than All X in the one case or than Some X in the other, do not exclude the possibility of the subject and predicate being co-extensive. Hence, however convenient it may be, Aristotle's nomenclature applies only, and that not with strict accuracy, to two forms of syllogism (Barbara and Darii) in the first figure.

§ 2. *On Moods and Figures.*

We now proceed to consider the possible, not the legitimate, forms of syllogism. Here there are two circumstances to be taken into consideration: 1st, that syllogisms may vary according to the quantity and quality of the propositions (A, E, I, O) of which they are composed; and, that they may vary according to the position of the terms in the premisses. It is by combining these two sources of variation that we shall obtain the number of possible syllogisms.

There are, if we take into consideration the conclusion, sixty-four possible combinations of the propositions A, E, I, O, i. e. in technical language, sixty-four possible *moods*, viz. AAA, AAE, AAI, AAO, &c. But if we consider the premisses only, the number of possible moods is limited to sixteen, viz. AA, AE, AI, AO, EA, EE, EI, EO, IA, IE, II, IO, OA, OE, OI, OO. In determining what possible moods are legitimate, we may either ask 'Is this conclusion legitimated by these premisses?' or 'To what conclusion do these premisses lead?' If we ask the former question, we must examine the sixty-four possible moods in which the conclusion appears as well as the premisses; if the latter, an examination of the sixteen possible combinations of premisses is sufficient.

With respect to the possible arrangements of the terms in the premisses (i.e. the *figures*, as they are technically called) there are also two modes of proceeding. Taking

no account of the conclusion (and therefore not knowing which is the major term and which the minor), and asking simply 'In how many ways can the middle term be combined with the other terms in the premisses?', there are three possible figures: viz. 1st, that in which the middle term is subject in one premiss and predicate in the other; 2nd, that in which it is predicate in both premisses; 3rd, that in which it is subject in both. But if we take account of the conclusion, we are able to distinguish the major and minor terms, and consequently the major and minor premisses. In this case, there are four possible figures, viz. 1st, that in which the middle term is subject in the major premiss and predicate in the minor; 2nd, that in which it is predicate in both premisses; 3rd, that in which it is subject in both; 4th, that in which it is predicate in the major premiss and subject in the minor. These four figures may be exhibited thus:—

Fig. 1.	Fig. 2.	Fig. 3.	Fig. 4.
BA	AB	BA	AB
CB	CB	BC	BC
∴ CA	∴ CA	∴ CA	∴ CA.

If we take no account of the conclusion, either extreme in the premisses may become the major term, and the three figures may be represented thus:—

Fig. 1.	Fig. 2.	Fig. 3.
BA	AB	BA
CB	CB	BC
∴ CA or AC	∴ CA or AC	∴ CA or AC.

### § 3. *Determination of the legitimate Moods of Syllogism.*

*Note.*—Few difficulties in elementary Logic are more likely to embarrass the beginner than the variety of methods of constituting the legitimate Moods of Syllogism. Sir W. Hamilton, as a consequence of quantifying the predicate, is able to represent all syllogisms as equations, and thus to exhibit every affirmative syllogism as a direct application of what is called the Law of Identity (Every A is A), and every Negative Syllogism as a direct application of the Law of Contradiction (No A is not-A). Besides Sir W. Hamilton, other logicians who do not, like him, quantify the predicate, have also attempted to enunciate general principles equally applicable to all syllogisms. See e.g. *Port Royal Logic*, part III. ch. x. Others (as Abp. Thomson, *Laws of Thought*, § 96, and Lambert, as quoted by Mr. Mansel in his *Notes on Aldrich* ch. iii. § 6) enunciate a distinct principle for each figure. Others (and pre-eminently Aristotle) enunciate a canon for the first figure, and test the validity of syllogisms in all other figures by reducing them to the first. Lastly, a favourite method amongst logicians is to enumerate the faults which are incident to a syllogism, and then reject those moods in which they are found. This method is often combined with one or more of the others. Aldrich, for instance, enunciates general canons of syllogisms, then uses the method

we have last explained, and finally reduces syllogisms in the other figures to their corresponding forms in the first.

---

In accordance with the ordinary practice of elementary treatises, and as being perhaps at first more intelligible to the learner, we shall take into consideration the conclusion, and consequently regard the number of figures as four, and that of possible moods as sixty-four, reserving for a note the shorter and more scientific procedure. The problem therefore now before us is to determine which of the sixty-four moods are admissible in each of the four figures.

In the first figure our task is easy. There we are able to establish a canon which will determine directly the legitimate moods.

With a little attention, the student will be able to perceive the truth of the following propositions:—

- (a) If one term be affirmed of another, and *this* of a third, the first term may be affirmed of the third.
- (β) If one term be denied of another, and *this* affirmed of a third, the first may be denied of the third.
- (γ) If one term be affirmed of another, and *this* denied of a third, we are not justified in drawing any conclusion as to the relation of the first to the third; for, if one term be denied of another, it does not follow that *whatever* may be predicated of this first term may also be denied of the other. Thus I may deny ‘red’

of 'blue,' but it does not follow that 'colour' which I predicate of 'red' may also be denied of 'blue.'

- (δ) If one term be denied of another, and this denied of a third, no conclusion can be drawn as to the relation of the first to the third; for, because I deny one term of another, it does not follow that whatever I can deny of the first can also be denied of the other, nor does it follow that it can be affirmed of it. Thus, because I can deny 'white' of crows, and 'black' of 'white,' (or rather of the corresponding common term 'white things'), it does not follow that I can deny 'black' of crows; nor, because I can deny 'yellow' of 'white' (or 'white things') as well as 'white' of crows, does it follow that I can affirm 'yellow' of crows.

Putting together these results, we obtain the following *canon of reasoning in the first figure*: If one term can be affirmed or denied of another, and this affirmed of a third, the first can be affirmed or denied (respectively) of the third; and, if these conditions are not fulfilled, no conclusion can be drawn<sup>2</sup>. The only moods which fulfil

<sup>2</sup> It is perhaps necessary to point out that the major premiss of a syllogism in the first figure must be universal, else its subject could not serve as the predicate of the minor; for we might be predicating in the minor exactly that part of the term which was not used as the subject of the major, and thus there would be no connection between the premisses.

the conditions of the canon are AAA, EAE, AII, EIO, AAI, and EAO. The conclusions of the two latter might be inferred, by Subaltern Opposition, from those of AAA and EAE, and hence they are called *Subaltern Moods*.

We have obtained, it will be observed, forms of syllogism capable of proving any one of the four propositions, A, E, I, or O, and into one or other of the types accepted as legitimate moods of the first figure all our mediate reasonings may be thrown. Here, then, our enquiry might terminate, if it were simply our object to obtain a sufficient number of legitimate types of reasoning, but the problem before us is to state exhaustively all possible forms which can be accepted as legitimate.

There being no canon which distinguishes with equal precision the legitimate and illegitimate moods of the other figures, we must, in discussing them, have recourse to some other method. We shall first enumerate and explain certain syllogistic rules (derived from the definition of a syllogism) which will exclude illegitimate moods, and then, before accepting the remainder, we shall test them by reducing them to the first figure.

### *Syllogistic Rules.*

I. *The middle term must be distributed at least once.* For, if in both premisses it were used in only a partial signification, it might denote entirely different objects in the one premiss from those which it denoted in the other,

and so there might be no connection between the two premisses. Thus, in the premisses 'All men are animals,' 'All horses are animals,' the part of the group 'animals' which is coincident with 'men' may be, and here is, entirely distinct from that portion of the group which is coincident with 'horses,' and consequently we can draw no conclusion as to the relation between men and horses.

II. *If a term be distributed in the conclusion, it must have been previously distributed in the premisses.* The reason is obvious. If we use a term in a partial signification in the premisses, we cannot legitimately use it in its entire signification in the conclusion. To do so would be to argue from part to whole.

This fallacy is called *illicit process* of the major or minor, according as the term illegitimately distributed in the conclusion is the major or minor term. In the syllogism

Some A is not B,  
All B is C;  
∴ Some C is not A,

we have illicit process of the major; in the syllogism,

All A is B,  
Some C is B;  
∴ All C is A,

illicit process of the minor.

III. *Two negative premisses prove nothing.* For they simply assert that there is no connection between the

middle term and the extremes; consequently we can draw no conclusion with respect to the relation of the extremes.

IV. *If either of the premisses be negative, the conclusion must be negative.* For the other premiss is affirmative, and, if in one premiss we affirm a connection between the middle term and one of the extremes, and in the other premiss deny any connection between the middle term and the other extreme, there can be no connection between the two extremes.

V. *If the conclusion be negative, one of the premisses must be negative.* For we cannot deny that there is any connection between the extremes, except we have previously denied that there is any connection between one of the extremes and the middle term.

VI. *Two particular premisses prove nothing.* For they cannot be both negative (O, O). Nor can they be both affirmative (I, I), for then the middle term would be undistributed. The only remaining case is that of one affirmative and one negative premiss (I, O). But this combination of premisses would leave no term to be distributed in the conclusion. Hence the conclusion would be an I proposition, an affirmative conclusion inferred from a negative premiss.

VII. *If one premiss be particular, the conclusion must be particular.*

1st. Let the particular premiss be I.

As this premiss distributes neither term, the middle term must be distributed (by Rule I) in the other premiss ;

But this premiss (by Rule VI) must also be universal ;

∴ It is either A or E.

(a). Let it be A.

As an A proposition only distributes one term, and that term must in the present case be the middle, no term is left to be distributed in the conclusion ;

∴ The conclusion is I.

(β). Let it be E.

If there be a negative premiss, there must (by Rule IV) be a negative conclusion ;

But, the premises being I, E, only one term is left to be distributed in the conclusion ;

∴ The conclusion is O.

2nd. Let the particular premiss be O.

The other premiss (by Rule III) must be affirmative, and (by Rule VI) universal ;

∴ It is A.

But in the two premisses (A, O) only two terms are distributed, of which one (Rule I) must be the middle ;

∴ One term only is left to be distributed in the conclusion, which, as there is a negative premiss, must be negative ;

∴ The conclusion is O.

The converse of this Rule, viz. that a particular conclusion necessitates a particular premiss, is not true. The only cases however in which we find a particular conclusion without a particular premiss are those in which the premisses assume more than is required in order to prove the conclusion. This will be apparent to the student from an examination of the individual cases, and it might be laid down as a rule that, wherever there is a particular conclusion without a particular premiss, something superfluous is invariably assumed in the premisses<sup>3</sup>.

Of the above Rules, it is plain that Rules III, IV, V, VI, VII are applicable to the moods before they are referred to the several figures, Rules I and II are applicable only when the moods are referred to some particular figure.

By the application of the first set of Rules, the sixty-four possible moods are reduced to twelve, viz.

AAA, AAI, AEE, AEO, AII, AOO,  
EAE, EAO, EIO, IAI, IEO, OAO.

<sup>3</sup> The syllogistic rules are comprised in the mnemonic lines :—

*Distribuas medium ; nec quartus terminus adsit.*

*Utraque nec præmissa negans, nec particularis.*

*Sectetur partem conclusio deteriore.*

*Et non distribuatur, nisi cum præmissa, negetve.*

Thus **EEE** is rejected because it has two negative premisses, **EAA** because it has a negative premiss without a negative conclusion, **AAE** because it has a negative conclusion without a negative premiss, **III** because it has two particular premisses, **IAA** because it has a particular premiss without a particular conclusion.

By the application of rules I and II to these twelve moods, when referred to the several figures, there remain :

in fig. 2, **EAE**, **AEE**, **EIO**, **AOO**, **EAO**, **AEO**;

in fig. 3, **AAI**, **EAO**, **IAI**, **OOA**, **AII**, **EIO**;

in fig. 4, **AAI**, **AEE**, **IAI**, **EAO**, **EIO**, **AEO**.

We append a few examples of the method of testing the moods, when referred to the figures.

Take **AEE** in figure 2.

A	All A is B,
E	No C is B;
E	∴ No C is A. No fault.

Take **IEO** in figure 3.

I	Some B is A,
E	No B is C;
O	∴ Some C is not A.

Illicit process of major.

Take **AII** in figure 4.

A	All A is B,
I	Some B is C;
I	∴ Some C is A. Undistributed middle.

It will be seen that of the sixty-four moods, when referred to the four figures, there are only six in each which have not been rejected. It now remains further to test these moods in the second, third, and fourth figures by reducing them to moods in the first.

### *Reduction.*

As we have adopted no canon for the second, third, and fourth figures, we have as yet no positive proof that the six moods remaining in each of those figures are valid; we merely know that they do not offend against any of the syllogistic rules. But, if we can *reduce* them, i. e. bring them back to the first figure, by shewing that they are only different statements of its moods, their validity will be proved beyond question. There are two methods of performing this operation: 1st. that called *Ostensive Reduction*, which consists in employing one or more of the processes of conversion, permutation, and] transposition of premisses; 2nd. that called *Reductio per impossibile*, which consists in shewing, by means of the first figure and the laws of opposition, that the contradictory of the conclusion is false, and therefore the conclusion itself true. Either of these methods is applicable to all the eighteen moods, and the result is that all are proved to be valid. We shall give instances of the application of each method.

By ostensive reduction we shall test E A O in the fourth, I A I in the third, A E E and A O O in the second figures.

Fig. 4.

E No A is B.  
A All B is C.  
O  $\therefore$  Some C is not A.

Fig. 1.

$\therefore$  No B is A. (Simple Conversion.)  
 $\therefore$  Some C is B. (Conversion per acc.)  
Some C is not A.

Fig. 3.

I Some B is A.  
A All B is C.  
I  $\therefore$  Some C is A.

Fig. 1.

All B is C.  
 $\therefore$  Some A is B. (Simple Conversion.)  
Some A is C.  
 $\therefore$  Some C is A. (Simple Conversion.)

Fig. 2.

A All A is B.  
E No C is B.  
E  $\therefore$  No C is A.

Fig. 1.

$\therefore$  No B is C. (Simple Conversion.)  
All A is B.  
No A is C.  
 $\therefore$  No C is A. (Simple Conversion.)

Fig. 2.

A All A is B.  
O Some C is not B.  
O  $\therefore$  Some C is not A.

Fig. 1.

$\therefore$  No A is not-B. (Permutation.)  
 $\therefore$  No not-B is A. (Simple Conversion.)  
 $\therefore$  Some C is not-B. (Permutation.)  
Some C is not A.

The mark  $\times$  shews that the premisses are transposed; the sign  $\therefore$  on the right-hand side of the page is here appropriated to express the employment of conversion or permutation. The last example is interesting, because A O O in fig. 2, and O A O in fig. 3, inasmuch as they contain O premisses, cannot be reduced by the ordinary methods of transposition of premisses and conversion. Hence the older logicians (who, with few exceptions, did not recognise permutation) applied to them the tedious method of *reductio per impossibile* (or, if we write it in full,

reductio per deductionem ad impossibile). This method is equally applicable to all the imperfect moods, as the moods of the three last figures are often called. We now proceed to give an example of it, and shall select AAI in the third figure.

A      All B is A,  
A      All B is C;  
I    ∴ Some C is A.

This conclusion must be true; for, if not, suppose it to be false,

Then its contradictory must be true, i.e.

No C is A.

But (from the premisses) All B is C.    }    Syll. II.

∴ (By figure 1) No B is A.

But (from the premisses) All B is A.

Now these two (being contrary propositions) cannot both be true.

But the proposition All B is A is assumed to be true.

∴ The proposition No B is A must be false.

Hence, either the reasoning of Syll. II. is faulty, or one of the premisses is untrue.

But the reasoning (being in the first figure) must be valid.

∴ One of the premisses is false.

Now the premiss 'All B is C,' being one of the premisses of the original syllogism, is assumed to be true.

∴ The other premiss (No C is A) must be false.

∴ Its contradictory (Some C is A) is true.

*Q. E. D.*

As the positive test of reduction confirms in every case the negative test of the syllogistic rules, we may consider six moods (though not the same six moods) as valid in each figure. These moods may be remembered by means of the mnemonic lines :

*Barbara, Celarent, Darii, Ferioque, prioris :*

*Cesare, Camestres, Festino, Baroko, secundæ :*

*Tertia, Darapti, Disamis, Datisi, Felapton,*

*Bokardo, Ferison, habet : Quarta insuper addit*

*Bramantip, Camenes, Dimaris, Fesapo, Fresison :*

*Quinque Subalterni totidem Generalibus orti,*

*Nomen habent nullum, nec, si bene colligis, usum.*

In the above lines, the initial consonants, B, C, D, F, shew that the mood in the second, third, or fourth figure to which they are prefixed is to be reduced to the mood correspondingly marked in the first. Thus Disamis, when reduced, will become Darii. The vowels shew the moods ; thus Disamis represents IAI in the third figure. The letter *s*, when it occurs after a vowel, shews that the proposition for which that vowel stands is to be converted simply, the letter *p* that it is to be converted *per accidens*. The letter *m* shews that the premisses are to be transposed, *k* that the mood is to be reduced *per impossibile*. It will be noticed that *k* occurs only in two moods, Baroko and Bokardo, but we have shewn that the *per*

*impossibile* method is equally applicable to all imperfect moods, and that these two moods can be reduced ostensibly by means of permutation, so that any imperfect mood may be reduced either ostensibly or *per impossibile*. The initial B in Baroko and Bokardo shews that the *per impossibile* method, in their case, assumes the validity of *Barbara*, but in other cases the operation may assume the validity of some one of the other moods in the first figure; thus, in the particular instance we have taken above, it is performed by means of *Celarent*. It is perhaps needless to add that all letters, not already explained, in the mnemonic lines, are non-significant.

The nature of the *subaltern moods* has already been explained. They are, AAI, EAO in fig. 1, EAO, AEO in fig. 2, and AEO in fig. 4, included respectively in AAA, EAE, EAE, AEE, AEE. They cannot properly be regarded as illegitimate, inasmuch as the conclusions are valid, but they are superfluous, inasmuch as they infer less than is justified by the premisses.

### *The Special Rules.*

Besides the general syllogistic rules, already enunciated and proved, certain Special Rules have been enunciated for each figure. We give them below as generally stated. Those for the first figure have been proved in establishing its canon; those for the other figures the student may verify for himself by applying the rules, already laid down, on the distribution of terms.

Fig. 1. (a) The major premiss must be universal.

( $\beta$ ) The minor premiss must be affirmative.

Fig. 2. (a) The major premiss must be universal.

( $\beta$ ) One or other premiss must be negative.

( $\gamma$ ) The conclusion must be negative.

Fig. 3. (a) The minor premiss must be affirmative.

( $\beta$ ) The conclusion must be particular.

Fig. 4. (a) When the major premiss is affirmative, the minor must be universal.

( $\beta$ ) When the minor premiss is affirmative, the conclusion must be particular.

( $\gamma$ ) In negative moods the major premiss must be universal.

---

*Note.*—If, leaving out of consideration the conclusion, we regard the number of possible figures as three and that of possible moods as sixteen, we may proceed as follows.

Having enunciated the canon of the first figure, we may constitute the moods *Barbara*, *Celarent*, *Darii*, and *Ferio*. The subaltern moods, AAI and EAO, are not admissible, as the question here before us is not ‘What conclusions are legitimated by such and such premisses,’ but ‘To what conclusions do such and such premisses lead?’ Now, from this point of view, the conclusions of the subaltern moods are not directly inferred from

the premisses, but are inferred by subalternation from the universal conclusions to which the premisses directly lead. The same observation will of course apply to the subaltern moods in the other figures.

If we take no account of the conclusion, we have no means of determining which is the major and which is the minor term. Consequently, the premisses may lead to two kinds of conclusions: 1st, those in which the predicate of the first premiss is predicated of the subject of the second; 2nd, those in which the subject of the second premiss is predicated of the predicate of the first. Now the canon of the first figure applies only to the first case; consequently we are bound to ask if any conclusions, falling under the second head, may be inferred from the premisses. These cannot be determined directly, but must be determined in the same manner as conclusions in the second and third figures. Here we proceed by a method similar to that employed in the text. The syllogistic rules exclude seven of the sixteen possible moods, viz. EE, EO, OE, OO, II, IO, OI. When the moods are referred to their several figures, we find that, where the extreme employed in the first premiss becomes the predicate, and the extreme employed in the second premiss the subject of the conclusion, the results are, in the second figure, *Cesare*, *Camestres*, *Festino*, *Baroko*; in the third, *Darapti*, *Disamis*, *Datisi*, *Felapton*, *Bokardo*, *Ferison*, the subaltern moods of the second figure EAO, AEO, being inadmissible. Where the extreme employed in the first premiss

becomes the subject, and the extreme employed in the second premiss the predicate of the conclusion, the results are, in the first figure, AAI, AEO, AII, EAE, IEO, which, when we transpose the premisses, become respectively *Bramantip*, *Fesapo*, *Dimaris*, *Camenes*, and *Fresison* in the fourth figure. Hence, according to this mode of treatment, the moods of the fourth figure are regarded as *indirect moods* of the first. Similarly, in the second figure we may constitute the *indirect moods* AEE, EAE, IEO, OAO. These, if we transpose the premisses, are merely a repetition of the ordinary moods of the second figure. This is also the case with the indirect moods of the third figure, viz. AAI, AEO, AII, AOO, IAI, IEO. It will therefore be seen that, with the exception of rejecting the subaltern moods, which even there we regarded as superfluous, we arrive practically at the same results as in the text. The moods of the fourth figure are recognised, but, instead of being regarded as moods of a distinct figure, they are treated as indirect moods of the first. By the expression 'indirect moods,' it will be seen, we mean moods in which the extreme employed in the first premiss becomes the subject, and the extreme employed in the second premiss the predicate of the conclusion.

so that the truth of one depends on the falsity of the other, and the falsity of one on the truth of the other, the complex proposition may be called *Disjunctive*. Thus we may give as instances of Conjunctive Propositions:—

If (or When, Where, Provided that, &c.) A is B, C is D; If A is not B, C is D; If A is not B, C is not D; If A is B and C is D, E is F; If A is B, either C is D or E is F or G is H; If either A is B or C is D, E is F.

It will be noticed in the second and third examples that negatives are introduced, but they are, notwithstanding, examples of conjunctive propositions, for C being D in the first case, and C not being D in the second, are made to depend on the *truth* of A not being B. As instances of Disjunctive Propositions we may give the following:—

Either A is B, or C is D; Either A is B, or C is D, or E is F; A is either B or C or D; Either A or B or C is D; Either A is not B, or C is not D; Either A is B, or C is not D.

This form of proposition implies that the truth of one member involves the falsity of the other, and, *vice versâ*, the falsity of one member the truth of the other.

It should be noticed that both conjunctive and disjunctive propositions admit of being reduced to the simple form. Thus:—

the word categorical (noticed above), it is extremely awkward to make hypothetical and conditional (which are synonyms) stand respectively for the genus and species. The words conjunctive and disjunctive serve also to point out that the division of complex propositions is exhaustive.

'If A is B, C is D' becomes 'The case of A being B is a case of C being D' or 'A being B involves as a consequence C being D.'

The disjunctive proposition, when analysed, contains four conjunctive propositions, each of which may be reduced to a simple proposition. Thus, 'Either A is B, or C is D' is equivalent to the four conjunctive propositions: If A is B, C is not D; If A is not B, C is D; If C is D, A is not B; If C is not D, A is B.

We now proceed to consider Complex Syllogisms, i.e. syllogisms which contain Complex Propositions.

## § 2. I. *Conjunctive Syllogisms.*

A Conjunctive Syllogism is a syllogism, one or both of whose premisses are conjunctive propositions; if only one premiss be conjunctive, the other must be simple. If both premisses be conjunctive, inasmuch as all conjunctive propositions rank as universal affirmatives, the syllogism, to be valid, must be conformed to Barbara in the first figure. Thus,

If A is B, C is D,

If C is D, E is F;

∴ If A is B, E is F,

is a valid syllogism; but the following would not be valid:

If A is B, C is D,

If A is B, E is F;

∴ If C is D, E is F.

Far the most common form however of a conjunctive syllogism is that in which the major is a conjunctive, and the minor a simple proposition. Of this there are four possible varieties, of which two are valid and two invalid. These may be represented thus:—

If A is B, C is D. (Major Premiss.)

(1) A is B; ∴ C is D.		(3) C is D; No conclusion.
(2) A is not B; No conclusion.		(4) C is not D; ∴ A is not B.

Hence we obtain the rule that, if we affirm the antecedent, we must affirm the consequent, or, if we deny the consequent, we must deny the antecedent; but, if we deny the antecedent or affirm the consequent, no conclusion can be drawn. The reason of this will be obvious on a little reflection. We assert that 'A being B involves as a consequence C being D;' hence, if we grant that A is B, it must follow that C is D; if we deny that C is D, it must follow that what involves it as a consequence must also be untrue; but C might still be D, though A were not B, nor would it follow from C being D that A was also B.

Syllogism (1) is called a *Constructive* conjunctive syllogism.

Syllogism (2) is called a *Destructive* conjunctive syllogism.

It may be useful to add a few examples of valid conjunctive syllogisms.

- (1)           : If A is B, C is not D.  
                  C is D;  
                   $\therefore$  A is not B.
- (2)           If A is not B, C is D.  
                  A is not B;   |   C is not D;  
                   $\therefore$  C is D.       |    $\therefore$  A is B.
- (3)           If A is not B, C is not D.  
                  A is not B;   |   C is D;  
                   $\therefore$  C is not D.   |    $\therefore$  A is B.
- (4)           If A is B, either C is D or F is G.  
                  A is B;       |   Neither C is D nor F is G;  
                   $\therefore$  Either C is D or F is G. |    $\therefore$  A is not B.
- (5)   If either C is D or F is G, either X is Y or V is W.  
          Either C is D or F is G; | Neither X is Y nor V is W;  
           $\therefore$  Either X is Y or V is W. |  $\therefore$  Neither C is D nor F is G.

### § 3. II. *Disjunctive Syllogisms.*

A Disjunctive Syllogism is a syllogism of which the major premiss is a disjunctive, and the minor a simple proposition.

We may indeed combine two disjunctive propositions, and draw conclusions from them, but we can only do so after reducing the disjunctive propositions to the conjunctive form. Thus from the two propositions Either A is B or C is D, Either A is B or E is F, we may draw

four conclusions, viz. If C is D, E is F; If C is not D, E is not F; If E is F, C is D; If E is not F, C is not D. But as these conclusions are really drawn from conjunctive propositions which are involved in the two disjunctive propositions, we are not justified in calling the syllogisms disjunctive. Hence, as will be noticed, our definition of disjunctive is not so wide as that of conjunctive syllogisms.

The disjunctive syllogism admits of four conclusions, which may be exhibited thus:—

Either A is B, or C is D.

(1)    A is B; $\therefore$ C is not D.		(3)    C is D; $\therefore$ A is not B.
(2)    A is not B; $\therefore$ C is D.		(4)    C is not D; $\therefore$ A is B.

We add a few examples:—

Either A is B, or C is not D.

(1)    A is B; $\therefore$ C is D.		(3)    C is not D; $\therefore$ A is not B.
(2)    A is not B; $\therefore$ C is not D.		(4)    C is D; $\therefore$ A is B.

Either A is B, or C is D, or E is F.

- (1) A is B;  $\therefore$  Neither C is D nor E is F.
- (2) A is not B;  $\therefore$  Either C is D or E is F.
- (3) Neither C is D nor E is F;  $\therefore$  A is B.
- (4) Either C is D or E is F;  $\therefore$  A is not B.

(5) Either A is B or C is D;  $\therefore$  E is not F.

&c.

&c.

He is either a fool or a knave.

(1) He is a fool;  
 $\therefore$  He is not a knave.

(2) He is a knave;  
 $\therefore$  He is not a fool.

(3) He is not a fool;  
 $\therefore$  He is a knave.

(4) He is not a knave;  
 $\therefore$  He is a fool.

*Note.*—Mr. Mill (in his *Examination of Sir W. Hamilton's Philosophy*, ch. xxiii.) maintains that a disjunctive proposition simply implies that the two alternatives cannot both be false, but that it does not exclude the possibility of both of them being true. Thus, in the last example, he would maintain that there is nothing in the form of the assertion to exclude the supposition of the man being both a fool and a knave. In this opinion he is preceded by many other logicians, but it seems to us that in the expression 'either — or —' we distinctly exclude the possibility of both alternatives being true, as well as of both being false. In fact, when we do not wish to exclude the possibility of both being true, we add the words 'or both,' thus: 'He is either a fool or a knave, or both;' 'I shall come either to-day or to-morrow or perhaps both days.'

§ 4. *The Dilemma.*

There remains the case in which one premiss of the complex syllogism is a conjunctive and the other a disjunctive proposition. This is called a *Dilemma*. The order of the premisses is indifferent, but it seems more natural that the conjunctive proposition should be the major. If we consider the case in which the major consists of one antecedent and several consequents, there is only one valid form of argument, and that is destructive.

- (1) If A is B, C is D and E is F ;  
       But either C is not D or E is not F ;  
        $\therefore$  A is not B.

If we asserted in the minor 'C is D and E is F' there would be no conclusion, and if we asserted 'Neither C is D nor E is F,' the minor would not be disjunctive. The assertion 'Either C is D or E is F' is, according to our view of the significance of a disjunctive proposition, equivalent to the assertion 'Either C is not D or E is not F,' and leads to the same conclusion.

If the major consist of several antecedents and one consequent, there is only one valid form of argument, and that is constructive.

- (2) If A is B or if E is F, C is D ;  
       But either A is B or E is F ;  
        $\therefore$  C is D.

If we asserted in the minor 'C is not D,' it would not satisfy the requirements of the definition by being a disjunctive proposition.

In the remaining case, where there are several antecedents and several consequents, there are two valid forms, one constructive and the other destructive.

- (3) If A is B, C is D; and if E is F, G is H;  
But either A is B, or E is F;

∴ Either C is D, or G is H.

- (4) If A is B, C is D; and if E is F, G is H;  
But either C is not D, or G is not H;

∴ Either A is not B, or E is not F.

It is evident that we may form a Trilemma, Tetralemma, &c., by increasing the number of antecedents or consequents or both, thus:—

If A is B, or if E is F, or if G is H, C is D;  
But either A is B, or E is F, or G is H;

∴ C is D.

If A is B, C is D; and if E is F, G is H; and if  
I is J, K is L;

But either A is B, or E is F, or I is J;

∴ Either C is D, or G is H, or K is L.

It is not uncommon to mistake for a dilemma what is really only a conjunctive syllogism. Thus the two following syllogisms, when examined, will be found to be, the first a constructive, the second a destructive conjunctive.

- (1) Whether geometry be regarded as a mental discipline or as a practical science, it deserves to be studied ;

But geometry may be regarded as both a mental discipline and a practical science ;

∴ It deserves to be studied.

- (2) If we go to war, we must either contract a debt, or increase the taxation, or indemnify ourselves at the enemy's expense ;

We shall not be able to do any of these ;

∴ We are not able to go to war.

In disputation, the adversary who is refuted by a dilemma is said to be ' fixed on the horns of a dilemma ;' he is said to *rebut* the dilemma, if he meet it by another with an opposite conclusion. Thus (to tell an old story) Protagoras the Sophist is said to have engaged with his pupil, Euathlus, that half the fee for instruction should be paid down at once, and the other half remain due till Euathlus should win his first cause. Euathlus deferred his appearance as an advocate, till Protagoras became impatient and brought him into court. The Sophist then addressed his pupil as follows : " Most foolish young man, whatever be the decision, you must pay your money ; if the judges decide in my favour, I gain my fee by the decision of the court, if in yours by our bargain." This dilemma Euathlus *rebutted* by the following : " Most sapient master, whatever be the decision, you must lose your fee ; if the judges decide it in my favour, you lose it

by the decision of the court, if in yours, by our bargain, for I shall not have gained my cause."

---

*Note.*—Of the four cases of dilemma which we have given, the first would not be admitted by Abp. Whately and Mr. Mansel, who define dilemma as 'A syllogism having a conditional (i.e. conjunctive) major premiss with more than one antecedent, and a disjunctive minor.' Having however a disjunctive minor, it cannot properly be regarded as a conjunctive syllogism, and it seems less arbitrary and more systematic to define dilemma as 'a syllogism of which one premiss is a conjunctive and the other a disjunctive proposition' than to limit it as above.

Few parts of Logic have given more occasion to differences of opinion or nomenclature than the theory of complex (or hypothetical) propositions and syllogisms. Sir W. Hamilton (see Appendix viii. to his *Lectures on Logic*) finally arrives at the opinion that "hypothetical and disjunctive judgments" are less complex than ordinary propositions, and that "hypothetical and disjunctive reasonings" are really forms of immediate inference. Thus he would represent the conjunctive syllogism in the form :—

If A is B, C is D ;  
 ∴ A being B, C is D.

The disjunctive syllogism he would represent in the form :—

Either A is B, or C is D ;  
 ∴ A not being B, C is D.

The other inferences from the premisses would, of course, be drawn similarly.

The dilemma would assume the form :—

If A is B, C is D; and if E is F, G is H ;

∴ either A being B, or E being F, it follows that

C is D, or G is H ;

or ∴ either C not being D, or G not being H, it follows  
that either A is not B, or E is not F.

## CHAPTER VI.

### *On the words 'Most,' 'Many,' &c., as expressing the Quantity of Propositions.*

TO all particular propositions we have prefixed the word 'some.' Both in conversation and reasoning, however, it frequently happens that we use some other sign of particularity, such as 'many,' 'most,' &c. Nor does there seem any valid reason why these forms should not be recognised by Logic. From what has already been said of particular premisses, it will be seen that wherever one premiss is universal and the other modified by some sign of particularity, as 'some,' 'many,' 'most,' &c., the conclusion must be modified by the same sign of particularity which is attached to the particular premiss. Thus, if we state as our premisses 'All crimes are to be punished,' 'Many offences against individual persons are crimes,' we must draw the conclusion that 'Many offences against individual persons are to be punished.'

'Two particular premisses prove nothing.' This is a general rule, and is strictly true where the premisses are quantified as 'some' — 'some.' But there is one case in which two particular premisses necessitate a conclusion. We will commence with a simple instance of it.

If two different predicates can both be predicated affirmatively of the greater number of individuals denoted by the same common term, there must be some individuals of which they can both be predicated, i.e. in certain cases the predicates must be predicable of each other. Thus, from the premisses

Most A are B,

Most A are C,

we must necessarily infer that Some B are C and Some C are B.

But we may draw the same conclusion, even in those cases in which both premisses are not quantified by the word 'most,' provided that the sum of the quantities by which the subjects are affected exceeds unity. Thus, from the premisses

Three-fourths of A are B,

One-third of A is C,

it follows that at least one-twelfth of A is both B and C; but if B and C be both predicable of the same objects, either must be, partially, predicable of the other. If, for instance, three men out of four exceed a certain height and one out of three a certain weight, at least one out of twelve must exceed both the given height and the given weight, and we may affirm both that Some men who exceed a certain height also exceed a certain weight, and that Some men who exceed a certain weight also exceed a certain height.

Of course, when we use such an indefinite word as 'most' in either premiss, the other premiss must be

quantified by an expression signifying at least one-half; else we cannot be sure that the quantities of the two premisses, when added together, exceed unity.

A conclusion of this kind can only be drawn where the subject in both premisses is the same term, i.e. in the third figure; for, in a logical proposition, we have no data to guide us with regard to the quantity of the predicate. Thus, from the premisses

Nineteen-twentieths of A are B,

Nine-tenths of B are C,

we can draw no conclusion as to the relation of A and C; for the tenth of B which is not C might be precisely that portion which was coincident with, or which contained, the nineteen-twentieths of A. Though, however, these syllogisms are confined to the third figure, they may be either affirmative or negative. Thus, from the premisses

Three-fourths of A are not B,

Two-thirds of A are C,

we may infer that five-twelfths at least of A are C and not B, and consequently that some C is not B, and some things which are not B are C.

It will be noticed that the conclusions of which we have been speaking are inferred with certainty, and are therefore to be distinguished from the conclusions in probable reasoning, which we are now about to discuss.

## CHAPTER VII.

### *On Probable Reasoning.*

IN discussing the copula, it was maintained that any modification of our assertions, such as the qualifications introduced by the words 'probably,' 'possibly,' &c., was, in the ultimate analysis of the proposition, to be referred to the predicate and not to the copula. Thus such a proposition as 'A is probably B,' when stated in its strictly logical form, would become 'That A is B is a probability.' It would however be tedious and practically useless to reduce all our propositions to such a form. We may therefore proceed to lay down rules for reasoning from propositions whose copula is modified, remembering however that they are not stated in strictly logical language.

The correctness of the following rule will be apparent. If a premiss whose copula is modified be combined with another premiss whose copula is unmodified, the copula of the conclusion must be modified also; the modality, of course, being the same as that in the premiss. Thus from the premisses 'All true poets are men of genius,' 'Sophocles is probably (certainly, possibly, &c.) a true poet,' I infer that Sophocles is probably (certainly, pos-

sibly, &c.) a man of genius. From a certain and a probable premiss, therefore, arranged according to the ordinary laws of syllogism, is to be inferred a probable conclusion. To this head may most conveniently be referred those syllogisms in which the major is a particular proposition introduced by the word 'most,' and the minor a singular proposition. Thus from the premisses, 'Most philosophers are men of vivid imagination,' 'A B is a philosopher,' I infer, as the conclusion, A B is probably a man of vivid imagination. If *most* philosophers possess certain characteristics, any particular philosopher will *probably* possess them, so that the major premiss is, in fact, equivalent to the proposition, 'A philosopher is probably a man of vivid imagination.'

Using the word 'probable' in the sense of 'more likely than not,' two probable premisses do not lead to a probable conclusion. This will be obvious from an easy example. Suppose there are in a bag four red, five blue, and six white balls; I may say with truth 'Any ball drawn at random from the bag is probably a red or blue ball;' I may also say with truth 'Any ball drawn at random from the red and blue balls is probably a blue ball;' but I cannot infer that 'Any ball drawn at random from the bag is probably a blue ball.' I shall only be justified in drawing the conclusion 'Any ball drawn at random from the bag is *possibly* a blue ball.' But, where our information is so special as in the above instance, a conclusion of this kind is far too vague. Is there no method which will enable me to state in the

conclusion the exact value of the expectation that any particular ball drawn at random may be blue, red, or white? For such a method I must have recourse to mathematics.

Though the word 'probable' is used in the sense of 'more likely than not,' the word 'probability' is used as the equivalent of 'chance' or 'expectation.' If it be three to two that a certain event will happen,  $3 : 2$  is called the *odds* for,  $2 : 3$  the *odds* against the event. Now the 'probability' or 'chance' of the event happening would be expressed by  $\frac{3}{5}$ , that of its not happening by  $\frac{2}{5}$ , the denominator in both cases being expressed by the sum of the terms of the odds, the numerator in the first case by the term of the odds for, in the latter case by the term of the odds against. If two events are independent of each other, the joint or compound probability that they will both happen must be much smaller than the probability that either of them will happen alone, and it is discovered by multiplying together the fractions which express the probabilities of their happening separately<sup>1</sup>. Thus, in the above instance, the chance of my drawing a red or blue ball =  $\frac{9}{15}$ ; the chance of my drawing out of the red and blue balls a blue ball =  $\frac{5}{9}$ ;  $\therefore$  the chance of my drawing a blue ball out of the bag which contains all =  $\frac{9}{15} \times \frac{5}{9} = \frac{1}{3}$ , a result at which, in this particular instance, I could of course have arrived more directly.

<sup>1</sup> The truth of this proposition, with regard to two, three, or any number of events, is proved at length in Peacock's *Arithmetical Algebra*, § 469.

Hence, when both premisses are affected by words like 'probably,' 'possibly,' &c., the probability of the conclusion may always be discovered by multiplying together the probabilities of the premisses, the conclusion being therefore less probable than either premiss. We append a few instances of conclusions drawn from probable premisses:—

- (1) This plant will probably sprout up during the winter months. (Let the probability =  $\frac{3}{5}$ .)

Whatever plant sprouts up during the winter will probably be bitten by the frost. (Let the probability =  $\frac{4}{7}$ .)

∴ This plant may be bitten by the frost. (Here the probability =  $\frac{3}{5} \times \frac{4}{7} = \frac{12}{35}$ .)

∴ The odds *against* the plant being frost-bitten are 23 to 12, and those *in favour* of its being frost-bitten are 12 to 23.

- (2) Two-thirds of these men will be enlisted.

Half the men enlisted are killed in battle.

∴ The probability of any particular man being killed in battle =  $\frac{2}{3} \times \frac{1}{2} = \frac{1}{3}$ .

∴ It is two to one against any particular man here being killed in battle.

- (3) A warm day may possibly be a rainy day. (Let the probability =  $\frac{1}{3}$ .)

A rainy day is probably not a windy day. (Let the probability =  $\frac{4}{5}$ .)

∴ A warm day may possibly not be a windy day. (The probability =  $\frac{4}{15}$ .)

The last example is useful as shewing the beginner that a conclusion highly probable in itself may receive little support from the premisses.

It is perhaps needless to remark that premisses, one or both of which are probable (possible, &c.), may be combined in any of the legitimate moods.

N. B.—It is most important for the student to bear in mind the ambiguous use of the words ‘probably,’ ‘probable,’ ‘probability.’ The adverb ‘probably’ we seem always to use in the sense of ‘more likely than not.’ The adjective ‘probable,’ when employed as a predicate, seems also to be invariably used in the same sense; thus we say ‘It is probable that he will do so and so,’ ‘This event is probable.’ But when used to qualify a substantive, as in such expressions ‘probable premisses,’ ‘probable reasonings,’ &c., it may either be employed in the above sense or simply as contrasted with certainty, and in the latter case the ‘probability,’ as we say, may vary from certainty to zero. Lastly, the word ‘probability’ may simply be equivalent to ‘chance,’ as explained above, or in some expressions it may have the meaning of ‘being more likely than not,’ as when we say ‘The probability is that he will do so and so.’ By ‘probable reasoning’ at the head of this section we of course mean reasoning which falls short of certainty, and the value of which may vary to any extent so long as it does not rise to certainty or fall to zero.

*On Circumstantial Evidence.*

Probable arguments may be combined together in a chain (or rather, as it has been called, a coil) of reasoning, each argument leading to the same conclusion. Instead of weakening each other, as is the case with probable premisses, such arguments, being all independent testimonies to the truth of the same conclusion, mutually strengthen each other. If the value of any single argument amounts to certainty, the conclusion must be true. In this case therefore we have to calculate the chances of failure in each separate argument; these, when multiplied together, give the probability of all the arguments together failing to prove the conclusion; and this fraction, when subtracted from unity (which represents certainty), gives the probability, resulting from all the arguments jointly, in favour of the conclusion. Thus suppose the probabilities in favour of certain probable arguments to be represented respectively by  $\frac{1}{3}$ ,  $\frac{2}{5}$ ,  $\frac{3}{4}$ ; the chances of their failing to prove the conclusion will be represented respectively by  $\frac{2}{3}$ ,  $\frac{3}{5}$ ,  $\frac{1}{4}$  (or the differences between the favourable chances and unity); the chance therefore of their all failing to prove the conclusion  $= \frac{2}{3} \times \frac{3}{5} \times \frac{1}{4} = \frac{1}{10}$ ; consequently the probability in favour of the conclusion, as based upon all the arguments jointly, is  $\frac{9}{10}$ , i. e. the odds in favour of it are 9 to 1.

We may illustrate this case by an example, which will also serve to shew the characteristic uncertainty attaching

to this method of reasoning. Suppose a man to be found lying dead on a road from the effects of a wound. On the same evening on which he died, another man was seen running away from the neighbourhood of the place. On this man's house being searched, his clothes are found to be stained with blood; his foot-steps correspond with those leading to and from the place where the dead man was lying; and moreover he is known to have possessed a weapon, now not to be found, which was capable of inflicting the wounds. The presumption in favour of his guilt is very great; each argument, taken alone, possesses some cogency, and when all the arguments are taken together they appear to be irresistible. But suppose the suspected man, when arrested, to give this account of the affair: he was walking along the road, armed with a dagger; he was suddenly attacked by another man; a scuffle ensued, and in the scuffle he killed his assailant; finding that he had killed him, he was seized with a sudden panic, threw away his weapon, and ran home. Such an account, in the case of a timid and secretive man, might possibly be true, and in estimating the counter-probabilities, we should have to consider the characters of the accused and the dead man, and the nature of the motive, if any, which could have led to the supposed crime. Suppose the dead man's pockets were rifled, and the accused (who had been previously convicted of a felony) were in possession of his money, there could be little doubt that he had committed a murder; but suppose that the

character of the accused was good, and no likely motive could be assigned for the commission of the crime, his own version of the affair might be accepted as probably true, or at least as throwing considerable doubt on the supposition of his guilt<sup>2</sup>.

Evidence of the kind we have been discussing is called *Circumstantial Evidence*, from the fact that several circum-

<sup>2</sup> As illustrating the danger of exaggerating the value to be attached to circumstantial evidence, we could hardly adduce a more forcible example than the following passage from Lord Coke (quoted by Bentham in his *Rationale of Judicial Evidence*, bk. v. ch. 15, § 2) :—

“Violenta presumptio is many times plena probatio; as if one be run thorow the bodie with a sword in a house, whereof he instantly dieth, and a man is seen to come out of that house with a bloody sword, and no other man was at that time in the house.”

To this Bentham replies by two counter-suppositions :—

“1. The deceased plunged the sword into his own body, as in the case of suicide: the accused, not being in time to prevent him, drew out the sword, and so ran out, through confusion of mind, for chirurgical assistance.

“2. The deceased and the accused both wore swords. The deceased, in a fit of passion, attacked the accused. The accused, being close to the wall, had no retreat, and had just time enough to draw his sword, in the hope of keeping off the deceased: the deceased, not seeing the sword in time, ran upon it, and so was killed.

“Other suppositions might be started besides these; nor do these exculpatives either of them seem in any considerable degree less probable than that criminative one: if so, the probability of delinquency, instead of being conclusive, is but as 1 to 2.”

Sometimes the individual arguments in a chain of circumstantial evidence are of so little value that, even when several of them are accumulated, they have no practical force. “Presumptio probabilis,” Lord Coke says rightly, “moveth but little, but presumptio levis seu temeraria moveth not at all.”

stances are adduced as all leading to the same conclusion. It will be seen that the utmost caution is required in estimating its value. We are bound to consider not only the circumstances which point to the conclusion, but also those which point against it, or in favour of any counter-supposition. It is only when we feel certain that we have exhausted all possible suppositions, consistent with the circumstances of the case, and considered carefully the value of the arguments, or series of arguments, pointing to each of them, that we are entitled to pronounce with confidence in favour of any particular conclusion.

Any single syllogism in a chain (or coil) of circumstantial evidence may be represented as an argument with one probable and one certain premiss, thus :

A man who was seen running away, in order to escape observation, from the place where the dead man was lying, immediately after his death, was probably the murderer,

This man was seen running away, &c. ;

∴ He was probably the murderer.

The major premiss of each of these syllogisms is the result of an analogical argument, and its value must be estimated according to the rules of analogy, already explained.

---

*Note.*—It is more usual to regard the separate syllogisms in a chain of circumstantial evidence as syllogisms

in the 2nd figure, involving an undistributed middle, and justifying a probable conclusion. Thus the above syllogism would be represented in the form :

The murderer would, to escape observation, run away, &c.,

This man, to escape observation, ran away, &c. ;

∴ This man is probably (or possibly) the murderer.

It seems however extremely awkward to represent such reasonings as fallacies, and then, by way of compensation, to regard them as probable arguments. This mode of treatment, no doubt, originated in the desire to conform the arguments in circumstantial evidence to those Enthymematic syllogisms of Aristotle which employ the *σημείον* in the second figure. For an account of the Enthymeme and its subdivisions, the student is referred to Trendelenburg's *Elements*, § 37, and Mr. Mansel's *Appendix to Aldrich*, Note F.

## CHAPTER VIII.

### *On Fallacies.*

§ 1. A FALLACY is, strictly speaking, a defective inference, but the word is, by common usage, extended to any error either in the premisses or in the conclusions of our arguments. In deductive Logic (for we are not here concerned with the fallacies incident to induction<sup>1</sup> or to the operation subsidiary to it, observation) these errors are traceable to one of four sources: the assump-

<sup>1</sup> The fallacy of False Analogy (which consists either in over-estimating, in some particular case, the value of the argument from analogy, or in supposing an analogy where none exists) falls properly within the domain of inductive Logic. It is not to be confounded with the fallacy arising from the employment in a syllogism of a word used analogously, as if it were used univocally, which, as already noticed, is one case of the fallacy of ambiguous terms. Thus to argue, because there are certain points of resemblance between the development of the individual and the development of the race, that, therefore, since the individual dies, the race will probably die also, or, because there are certain points of resemblance between the earth and the other planets, that, therefore, the other planets are certainly, or very probably, inhabited, would both be instances of false analogy, the former being an extension of the analogy from cases in which it does apply to others in which it does not, the latter being an exaggeration of the value, in that particular case, of the probable argument. But to argue, because art (i. e. artistic skill) requires the highest intellectual gifts, and dissimulation is art (i. e. deceit), that, therefore, dissimulation requires the highest intellectual gifts, is obviously a mere play upon words, and owes its semblance of reasoning simply to the ambiguity of language.

tion of a false premiss, neglect of the laws of deductive inference, irrelevancy, and ambiguity of language. Any conclusions therefore, or series of conclusions, which transgress no law of inference, which are derived from true premisses, which are relevant to the matter under discussion, and which, with their premisses, are expressed in unambiguous language, may be regarded as faultless.

§ 2. I. A false premiss, borrowed from some science which is not under investigation, can only be detected by a special knowledge of the science from which it is taken. Many fallacies, described in the old books on Logic, are really instances of the assumption of a false premiss, and therefore specially concern other sciences rather than logic. Thus the celebrated fallacy of Achilles and the tortoise assumes as its major premiss a false proposition, viz. 'that the sum of an infinite series of constantly decreasing terms is an infinite number.'

§ 3. II. The fallacies due to the neglect of the laws of deductive inference (which, strictly speaking, are the only fallacies to be detected by a mere knowledge of Deductive Logic) have already, to some extent, been discussed. The principal sources of fallacy in a single inference are illicit process and undistributed middle. A not infrequent instance of undistributed middle is the following:—

All Conservatives (Liberals, Roman Catholics, Protestants, Englishmen, Frenchmen, &c.) hold such and such opinions, do such and such things, or possess such and such characteristics;

A B holds such and such opinions, does such and such things, or possesses such and such characteristics ;

∴ A B is a Conservative (Liberal, Roman Catholic, &c.).

We might, of course, argue quite as legitimately that because both men and cats are animals, all men are cats. If, however, the argument assumed this shape,—

None but Liberals (Roman Catholics, &c.) hold such and such opinions, or do such and such things ;

This man holds such and such opinions, or does such and such things ;

∴ He is a Liberal (Roman Catholic, &c.),  
it would be perfectly legitimate.

The major premiss in this case is equivalent to the proposition ‘All men who hold such and such opinions, or do such and such things, are Liberals (Roman Catholics, &c.)’. As was shewn in the Chapter on Probabilities, we might also advance a perfectly legitimate argument of the following kind : ‘A man who holds such and such opinions, or does such and such things, is probably a Liberal (Roman Catholic, &c.); this man holds such and such opinions, or does such and such things ; therefore he is probably a Liberal (Roman Catholic, &c.)’.

Of Illicit Process the following syllogisms may serve as examples :—

No form of democracy excludes the great mass of  
the people from political power,

Any form of government which excludes the great

mass of the people from political power is subject to violent revolutions ;

∴ No form of democracy is subject to violent revolutions.

The early history of some nations is full of incredible events,

A history which is full of incredible events is not worthy of serious study ;

∴ The early history of any nation is not worthy of serious study.

The former syllogism (AEE in the first figure) involves illicit process of the major, the latter (EIE in the first figure) illicit process of the minor. It will be observed that the various propositions are not stated in strictly logical form, though they easily admit of being so stated, and that the premisses of both syllogisms require to be transposed.

Where there is a long train of reasoning in which one syllogism is employed to prove the premiss of another, and so on, a fallacy frequently occurs, which often escapes detection. This is called the *Argument in a Circle*. A book is written, or a speech is made, with the object of proving some controverted opinion. The author or speaker, being full of one idea, after a little preliminary matter, assumes the proposition to be proved, slightly disguised, probably, under some equivalent form ; from this he deduces various conclusions, and these conclusions, when put together, of course triumphantly

establish, from various sides, his view of the controversy. This is not an unfair analysis of many elaborate arguments, the fallacy being, in the great majority of instances, undesigned, and imposing on the author or speaker himself quite as much as on his readers or auditors. The fallacy, when expressed in its naked form, may be described as the assumption, in a train of reasoning, of the conclusion of a subsequent syllogism as a premiss of a precedent syllogism. It may be represented thus:—

Syll. (1)	B is A,	Syll. (2)	C is A,
	C is B;		B is C;
	∴ C is A.		∴ B is A.

Thus, when asked why B is A, we reply, because C is A; and when asked why C is A, we reply, because B is A.

Of course, in actual argument, hundreds of intermediate syllogisms might occur between syll. (1) and syll. (2). The larger the number of intermediate steps, the more likely is the fallacy to escape detection, and, conversely, the true mode of exposing the fallacy, as Whately observes, is to *narrow* the circle by cutting out the intermediate steps, and exhibiting the assumption of the conclusion in its naked form. This fallacy is to be regarded as a breach of the laws of inference, because, when reduced to its simplest terms, it is a proving of the conclusion by means of itself, instead of by means of premisses which *jointly* necessitate it. But, unlike the fallacies of illicit process, &c., already treated, it cannot

be detected from the inspection of a single syllogism, but requires the comparison of two or more.

The argument in a circle is the most important case of the fallacy called *Petitio Principii* (or *begging the question*). The other cases of *petitio principii* generally enumerated are (2) when the conclusion simply re-asserts a premiss of the same syllogism <sup>2</sup>, (3) when it is exactly synonymous with <sup>3</sup> one of the premisses, (4) when one of the premisses is equally unknown with the conclusion, (5) when it is more unknown. Cases (4) and (5) are really instances of the assumption of a false premiss, or at least of a premiss which is not known to be true. Cases (2) and (3) arise from a neglect of the laws of syllogism, for, instead of proving the conclusion from the two premisses *jointly*, we simply re-assert one of the premisses <sup>4</sup>.

<sup>2</sup> If a syllogism, in which one of the simpler forms of *petitio principii* occurs, were stated at length, one of the premisses would be otiose (i. e. would not contribute towards the conclusion), but, as already noticed, we generally in our reasonings, as actually expressed, suppress one of the premisses.

<sup>3</sup> "The English language," says Archbishop Whately (*Elements of Logic*, bk. iii. § 13), "is perhaps the more suitable for the Fallacy of *petitio principii*, from its being formed from two distinct languages, and thus abounding in synonymous expressions, which have no resemblance in sound, and no connexion in etymology; so that a Sophist may bring forward a proposition expressed in words of Saxon origin, and give as a reason for it, the very same proposition stated in words of Norman origin; e. g. 'to allow every man an unbounded freedom of speech must always be, on the whole, advantageous to the State; for it is highly conducive to the interests of the Community, that each individual should enjoy a liberty, perfectly unlimited, of expressing his sentiments.'"

<sup>4</sup> It has sometimes been maintained that every syllogism is a *petitio*

§ 4. III. The fallacy of Irrelevancy (or, as it is sometimes called, shifting ground) is technically termed *Ignoratio Elenchi*, i. e. ignorance of the syllogism required for the refutation of an adversary. Thus, in the strictest sense of the words, *ignoratio elenchi* is committed by a person who in a disputation does not confine himself to proving the contradictory of his adversary's assertion, or who proves a proposition other than the contradictory. But, like many other terms borrowed from the dialectical disputations of the ancients, this has now received a wider meaning. Whenever an argument is irrelevant to the object which a speaker or writer professes to have in view, it is called an *ignoratio elenchi*. Thus, if I am endeavouring to convince a person that some particular measure is for his personal interest, and I adduce arguments to prove that it contributes to the general utility, or that it is the necessary consequence of other acts of legislation, I am guilty of an *ignoratio elenchi*, as I should also be if, when it was my object to establish either of the other two conclusions, I were to appeal to his personal interest. When the question at issue is the

*principii*. Of course the controversy entirely turns upon the meaning of the terms, but, according to the account we have given of the two, a syllogism is so far from being a *petitio principii*, that every *petitio principii* is a distinct breach of the laws of syllogism. The conclusion of a syllogism is indeed implied by the two premisses taken in combination, but, in a *petitio principii*, the conclusion is merely a re-assertion of one of the premisses: in the simpler cases, of a premiss in the same syllogism; in the argument in a circle, of a premiss in one of the preceding syllogisms of the series.

truth of an opinion, it is an *ignoratio elenchi* to attack it for its novelty, or for its coming from a foreign source, or for any supposed consequences which may result from it, or to try to throw discredit on its author by saying that it has often been started before, and so is no discovery of his.

This fallacy is more common in spoken addresses than in books, as the feelings both of speaker and auditory being more excited, and their judgment less critical, they are less likely to insist on relevancy of argument. On such occasions it most commonly takes the form of an *argumentum ad hominem*, whereby the speaker, in support of the truth of his assertions, or to throw discredit on an adversary, appeals, not to the unbiassed judgment of his auditors, but to their passions, interests, prejudices, sentiments, and associations. The *argumentum ad hominem*, however, is not confined to set speeches; it sometimes occurs in writings, and frequently in debates. In the latter, it often assumes the shape of an appeal to the previous acts, or the previously expressed convictions of the opponent; 'That measure, or that argument, or that proposal does not come well from you, who once proposed such a measure, or expressed such an opinion, or advanced such an argument, or did such and such acts.' There are occasions when the *argumentum ad hominem* may legitimately be used as a retort, but it must be advanced as such, and not as an argument. It is so called in opposition to the *argumentum ad rem* or *ad judicium*. Similar phrases are used to express other

forms of the *ignoratio elenchi*, as e.g. the *argumentum ad verecundiam*, *argumentum ad baculum*, &c. The *argumentum ad populum* we have treated as identical with the *argumentum ad hominem*; if called on to distinguish them, which seems unnecessary, we should refer the first to addresses made in the presence of a large auditory, the second to disputations with one or a few individuals<sup>5</sup>.

§ 5. IV. The fallacies originating in ambiguity of language we noticed when warning the student against the employment of equivocal terms. This fallacy (whether we call it that of equivocal terms, of ambiguous terms, or of ambiguity of language) of course includes fallacies arising from any ambiguity which may attach to the quantity of the subject, as e.g. the fallacy arising from the ambiguous use of the word 'all,' which will be noticed below.

We now proceed to notice one or two common cases of this fallacy. The same term may often be used in one place distributively and in another collectively, and we may argue as if the term in both places had the same meaning. This is called the fallacy of *Composition* or *Division*; of composition, if we argue from a term taken distributively as if it were taken collectively; of division, if we argue from a term taken collectively as if it were taken distributively. Thus (to give one of the common instances) 7 and 2 are (distributively) odd and even,

<sup>5</sup> The student will find some amusing examples of *ignoratio elenchi*, or irrelevant argument, in Sydney Smith's well-known *jeu d'esprit*, the *Noodle's Oration*. •

nine is 7 and 2 (collectively);  $\therefore$  nine is odd and even. Here we argue from 7 and 2 taken distributively, as if they had been taken collectively, and the fallacy is one of composition. Again, The people of England have a prejudice against the French, he is one of the people of England;  $\therefore$  he has a prejudice against the French. The major premiss might be quite true, and still the particular man spoken of might have a strong sympathy with the French, and be a warm admirer of their institutions. Here we argue from the term 'people,' taken collectively, as if it had a distributive signification and whatever were predicable of the English people might be predicated of every single individual amongst them; hence the fallacy is one of division. The last instance is an example of a very common source of deception. A certain people, corporation, or society, in its collective capacity, has certain characteristics, has performed certain acts, passed certain resolutions, or is known to have expressed certain sentiments; hence it is unreflectingly supposed that any particular individual belonging to the class has the same characteristics, participates in the same sentiments, and has joined in the same acts. In many cases, of course, he may be a strong dissident, and may have actively opposed the measures adopted.

The ambiguous use of the word 'all' furnishes a good instance of the fallacies of composition and division. We may argue from 'all,' meaning all taken together, as if it meant all severally, and thus commit the fallacy of division; or from 'all,' meaning all severally, as if it

meant all taken together, and thus commit the fallacy of composition. Thus, when I say 'All these boxes weigh so much,' or 'All these men can eat so much,' I leave it doubtful whether I mean all taken together or all taken severally. The ambiguity may be removed by substituting for the word 'all,' when used in a distributive sense, 'every,' and, when used in a collective sense, 'the whole of.'

Another pair of fallacies which falls under the head of 'ambiguous terms' is the pair known as the *Fallacia Accidentis* (or the *Fallacia a dicto simpliciter ad dictum secundum quid*) and the *Fallacia a dicto secundum quid ad dictum simpliciter*. In the first we argue from what is true as a general rule (i.e. unless there be some modifying circumstances) as if it were true under all circumstances; in the second from what is true under certain special circumstances as if it were true as a general rule. Thus a particular walk may be an agreeable one, but it does not follow that it would be so in wet or windy weather; plain-speaking, frugality, generosity, may all be virtues, but it does not follow that it would be virtuous to practise them on all possible occasions. Or, to take instances of the second fallacy, a political revolution may, under particular circumstances, be necessary to the welfare or existence of a country, but it does not follow that a state of society, in which political revolutions are frequent, is either necessary or desirable; it may be necessary if I am suffering from a particular disease that I should take opium or abstain from labour, but it does not follow that these would be good for me when I am

restored to health. These fallacies are due to our not sufficiently qualifying the terms which we use, and, by insisting on precision of language, they may always be avoided.

Though the definitions we have given of this pair of fallacies are conformable to the usage of most modern logicians<sup>6</sup>, and are stated in a form which is most likely to be of practical service to the student, they do not exactly correspond with the original meaning of the expressions. The 'Fallacia Accidentis' and the 'Fallacia a dicto secundum quid ad dictum simpliciter,' according to their original usage, applied to those cases in which a term, when not implying accidents, was confounded with the same term, when implying accidents. Thus, to take the common instance (which is sufficiently absurd): 'What you buy in the market, you eat; raw meat is what you buy in the market;  $\therefore$  raw meat is what you eat.' Here it may be replied that what we buy in the market we do indeed eat, but not necessarily in the same state in which we buy it at market<sup>7</sup>. This particular instance is an

<sup>6</sup> As, for instance, Mill (*Logic* bk. v. ch. 6, § 4), *Port Royal Logic* (part iii. ch. 19, § 5, 7). The latter virtually treats both fallacies as if they were a dicto secundum quid ad dictum simpliciter.

<sup>7</sup> Mr. De Morgan adduces one of Boccaccio's stories as affording an amusing instance of the fallacia accidentis. It is the old example of the 'raw meat' in another form:—

"A servant who was roasting a stork for his master was prevailed upon by his sweetheart to cut off a leg for her to eat. When the bird came upon table, the master desired to know what was become of the other leg. The man answered that storks had never more than one leg. The master, very angry, but determined to strike his servant dumb

example of the Fallacia Accidentis. From their technical meaning, these fallacies would easily pass into their present signification, which is both more intelligible and of greater practical service.

We may notice one more example of the errors due to ambiguous language, viz. the fallacy of what may be called *Paronymous Terms*. The same word may often assume different forms, as substantive, adjective, adverb, or verb, but it does not follow, when it has assumed these different forms, that they all retain corresponding meanings. It has been already noticed that the words probably, probable, probability, though the two last are themselves ambiguous, vary in meaning, according as we use the adverb, the adjective, or the substantive. Thus, if I hear some one ask the question 'What is the probability of my throwing an ace with a die at a single throw?', I cannot infer that in any single throw I shall probably throw an ace. Again, because a man has committed an unjust act (i.e. an act which in its results is unjust), I cannot infer that he has acted unjustly (i.e. with intentional injustice), nor, even if he has acted unjustly (i.e. in one or more instances), can I infer that he is an unjust man (i.e. a man of unjust habits or character). To take an old instance, because projectors are unfit to be

before he punished him, took him next day into the fields where they saw storks, standing each on one leg, as storks do. The servant turned triumphantly to his master, on which the latter shouted, and the birds put down their other legs and flew away. 'Ah, sir,' said the servant, 'you did not shout to the stork at dinner yesterday: if you had done so, he would have shewn his other leg too.'"

trusted, and this man has formed a project, it does not follow that he is unfit to be trusted. Nor from the meanings attached to the adverbs, kingly, nobly, gentlemanly, can we argue to the usual qualities of a king, a nobleman, or a gentleman; nor, on the meanings of the words 'to trow,' 'to represent,' can we base any sound argument as to the nature of truth, or the duties of a representative. All instances of this fallacy, when stated syllogistically, involve four terms, and so offend against the rules for the construction of a syllogism, but, as we do not ordinarily state our arguments in a syllogistic shape, and these fallacies undoubtedly impose on us through the ambiguity of language, it is better to consider them here rather than under the second head.

Many other forms of fallacy may be regarded as due to ambiguities of language, but it has perhaps been the tendency of modern logicians, and especially of Whately, to overload this division of fallacies, and to treat as merely differences of language what are in reality radical differences of opinion. At the same time, it cannot be denied that terms expressive of fundamental conceptions in their several sciences, such as faith, church, election, law, loyalty, federation, justice, value, capital, force, nature, natural, &c., are frequently used, in the same discussion, in the most widely divergent senses, and are consequently the source of endless confusion in our reasonings. Thus the term 'faith' may mean either a *belief* in certain propositions, or *confidence*, trust, and repose in a certain person; the word 'church' may mean the whole body of Christians (and,

of course, in this sense its signification will vary according to the meaning attached to the term Christian), a particular section of Christians, a congregation meeting in a certain place, the place of meeting, and, lastly, by a strange perversion of the term, the clergy as distinguished from the laity; the term 'loyalty' may mean either attachment to the laws of a country in general, special attachment to some particular portion of the laws, or, in its most restricted sense, personal attachment to the supreme ruler; 'capital' may mean either the amount of money possessed by a trader, or his whole stock of commodities available for future production; 'natural' may express either the original condition of a thing, or the state into which it is ultimately developed, besides having countless other meanings. On account of the various significations which may be attached to the same term, it is necessary, in entering on any investigation, carefully to define the terms to be employed, and never, without express notice, to deviate from the sense thus imposed upon them.

## CHAPTER IX.

### *On Method as applied to the arrangement of Syllogisms in a Train of Reasoning.*

WE do not propose to treat of Method in general (for this would involve a discussion of induction and the various relations in which it stands to deductive inference), but it may be useful to the student if we offer a few remarks on Method under the limitation stated in the heading of this chapter. When syllogisms are combined in a train of reasoning, we may either commence with the conclusion, and ask what reasons we have for believing it, and then go on to ask the reasons for believing the premisses, and so on, till at last we arrive at some propositions of which there is no doubt, or in which we at least can acquiesce; or else we may follow the reverse process, and commencing with propositions which are the result of some previous investigation, or which we at all events accept as true, may go on combining them with each other, till at last we arrive at some conclusion which we regard as sufficiently important to terminate our enquiries. The former method will be familiar to our readers as that by which we solve algebraic equations and what are called 'geometrical deductions,' and in fact as the method which

we generally though not universally employ when we are attempting to resolve difficulties for ourselves; the latter as the method by which the propositions in Euclid are proved, and in fact as the method which we generally though not universally employ, when it is our object to teach others, either orally or by book. Now the former method is called *Analytical* (from the Greek word ἀνάλυσις), because it may be regarded as the breaking up of a whole into its parts, the resolution of the final conclusion of a series of syllogisms into the various premisses on which it depends, and of which it is, as it were, the total expression. The latter method is called *Synthetical* (from the Greek word σύνθεσις), because it may be regarded as the putting together of the parts into a whole, the combination of the various premisses into a conclusion which is, as it were, their total result. Similarly in chemistry we speak of the analysis of any compound substance into its constituent elements, or of the synthesis of the constituent elements into the compound substance.

The words *a priori* and *a posteriori* may also be used to express the same distinction. In inductive inference (to which these terms are more properly applied) we are said to proceed *a posteriori*, when, a certain event having taken place, we attempt to trace the steps by which it came about, or, a certain phenomenon being presented to us for examination, we attempt to infer the mode of its production; and, vice versâ, we are said to proceed *a priori*, when, from our knowledge of certain circumstances, we attempt to predict an event, or, by putting in opera-

tion certain causes, we attempt to discover their effect. Similarly, in deductive inference, if, a conclusion being assumed as provisionally true, we attempt to discover reasons for it, we may be said to proceed *a posteriori*; if, starting with the premisses, we go on combining them to see whither they will lead us, we may be said to proceed *a priori*. In the former method of reasoning, we are peculiarly liable to impose on ourselves or others by availing ourselves of premisses which are fanciful, obscure, incapable of proof, questionable, or untrue, especially if the conclusion express some cherished conviction or some position which it is the interest of ourselves, our class, or our party to accept and to disseminate. Whenever, therefore, we argue from our conclusions backwards, especial caution is required, if it be our sincere desire to test our convictions impartially.

---

*Note.*—For an account of the various senses in which the words ‘analysis’ and ‘synthesis’ are or have been employed the student is referred to Sir W. Hamilton’s *Lectures on Logic*, Lect. xxiv, and Mr. Mansel’s Edition of *Aldrich*, Appendix G.

## Clarendon Press Series.

**Books already published, and nearly ready for publication.**

1. **Chemistry for Students.** By A. W. WILLIAMSON, Phil. Doc., F.R.S., Professor of Chemistry, University College, London. (Crown 8vo., cloth, price 7s. 6d.)

**Also: Solutions of the Problems in "Chemistry for Students."** By the same Author. (Sewed, price 6d.)

2. **Greek Verbs, Irregular and Defective;** their forms, meaning, and quantity; embracing all the Tenses used by Greek writers, with references to the passages in which they are found. By W. VEITCH. New and revised edition. (Crown 8vo., cloth, 616 pp., price 8s. 6d.)
3. **An Elementary Treatise on Heat,** with numerous Woodcuts and Diagrams. By BALFOUR STEWART, LL.D., F.R.S., Director of the Observatory at Kew. (Crown 8vo., cloth, price 7s. 6d.)
4. **The Elements of Deductive Logic,** designed mainly for the use of Junior Students in the Universities. By the Rev. T. FOWLER, M.A., Fellow and Tutor of Lincoln College, Oxford. (Crown 8vo., cloth, price 3s. 6d.)
5. **The Golden Treasury of Ancient Greek Poetry;** being a Collection of the finest passages in the Greek Classic Poets, with Introductory Notices and Notes. By R. S. WRIGHT, M.A., Fellow of Oriel College, Oxford. (Crown 8vo., cloth, price 8s. 6d.) [*Ready.*]
6. **Specimens of Early English;** being a Series of Extracts from the most important English Authors, Chronologically arranged, illustrative of the progress of the English Language and its Dialectic varieties, from A.D. 1250 to A.D. 1400. With Grammatical Introduction, Notes, and Glossary. By R. MORRIS, Esq., Editor of "The Story of Genesis and Exodus," &c. (Crown 8vo.) [*Nearly ready.*]

**MACMILLAN and Co. London.**

November, 1866.]

## UNIVERSITY OF OXFORD.

### Clarendon Press Series.

THE DELEGATES of the Oxford Press understand from eminent Schoolmasters and others who are authorities upon education, that there is still great need of good School Books and Manuals.

They are told that Editions with good English notes of many of the Greek and Latin Classics read in the higher classes of the Public Schools are required; that text-books, both English and Foreign, are much needed for the use of Schools, especially with reference to the Local Examinations held by the Universities; that good English and other Grammars, and Exercise-books adapted to them and with a copious supply of Examples, are much needed and that there is a great and urgent want of Delectuses, Analecta, and generally of books of Selections from Authors, for use in Schools;—

That the Histories now read in Schools are greatly below present requirements, and in some cases there are absolute deficiencies; and that the want of good books on History is much felt in the Law and Modern History School in the University;—

That English Treatises on Physical Science, written with clearness and precision of language, and adapted for use in the higher classes of Schools, and in the Natural Science School of the University, do not exist.

They believe that the University may with propriety and efficiency do much towards remedying the defect. They have therefore determined to issue a series of Educational Works, hoping to supply some existing wants, and to help in improving methods of teaching.

The departments of Education which they propose to deal with at present are the following :—

I. CLASSICS. The Delegates hope to issue

1. Works suitable for the Universities and the highest forms of Schools; or
2. Books for School-work generally, beginning from the very rudiments.

II. MENTAL AND MORAL PHILOSOPHY.

III. MATHEMATICAL WORKS; both for University Students, and also with especial regard to the needs of Middle Class Schools.

IV. HISTORY. Here again there will be two classes of books :—

1. Short Histories, such as may be useful for the History School, or for general reading;
2. School Histories, with all the necessary appliances for education.

V. LAW.

VI. PHYSICAL SCIENCE. The experience of teachers in the University and elsewhere has already pointed out several desirable works, and has also gone some way towards providing the books required.

VII. ENGLISH LANGUAGE AND LITERATURE, which will comprise a carefully compiled series of Reading Books, Exercise Books, and Grammars.

VIII. MODERN LANGUAGES.

IX. A MISCELLANEOUS CLASS; including Handbooks on Art, Music, Literature, and the like.

X. A SERIES OF ENGLISH CLASSICS.

*The DELEGATES OF THE PRESS invite suggestions and advice from all persons interested in sound education; and will be thankful for hints, &c., addressed to the Rev. G. W. KITCHIN, Walton Manor, Oxford.*

## Just Published.

1. **Chemistry for Students.** By A. W. WILLIAMSON, Phil. Doc., F.R.S., Professor of Chemistry, University College, London. (Crown 8vo., cloth, price 7s. 6d.)

Also: **Solutions of the Problems in "Chemistry for Students."** By the same Author. (Sewed, price 6d.)

"Within less than four hundred pages of a handy little volume, in type not fatiguing to the eye, Professor Williamson here gives to the student an outline of the leading facts and principles of inorganic and organic chemistry.

"Very few men are able to compress, within such limits, so large a topic, and of those who should attempt to do so almost all would fail to keep together soul and body of the science. Even in large treatises there is a tendency to part principles from facts. Having taken the life out of the body in a few preliminary chapters, the learned expositor confines all further attention to the corpse. While this is true of many a large book, in a small book we get usually facts alone or principles alone, if not the two in a state of repulsion. Professor Williamson is accurately technical and so concise that at a glance his pages might seem to contain only the *caput mortuum* of a great science. But let a chapter be read, and the truth appears that the student who reads such a book as this is in the hands of a singularly skilful teacher who knows how, without waste of a word, to fix intelligent attention. Out of experiments and observed facts arranged in a clear logical order he develops principles, and points to the part they play in the world's life. Step by step the student is led, not blindfold but with his attention constantly directed to the landmarks on his way. For example, the book begins by telling the learner how to make oxygen. There is a diagram of the arrangement necessary, and a clear explanation of the process of getting the gas from chlorate of potash or manganese. Then there is an equally clear account (with a diagram) of Lavoisier's experiment for getting oxygen out of the common air. \* \* \* \*

"A volume constructed in this way is really a too rare example of what a good elementary text-book in any science ought to be: the language brief, simple, exact; the arrangement logical, developing in lucid order principles from facts, and keeping theory always dependent upon observation; a book that keeps the reason of the student active while he strives to master details difficult but never without interest, and that furnishes him with means for practising himself in the right management of each new tool of knowledge that is given to him for his use."—*Examiner*.

2. **Greek Verbs, Irregular and Defective; their forms, meaning, and quantity; embracing all the Tenses used by Greek writers, with references to the passages in which they are found.** By W. VEITCH. New and revised edition. (Crown 8vo., cloth, 616 pp., price 8s. 6d.)

"The 'Clarendon Press Series' makes an excellent start, and if its succeeding volumes are to combine anything like the distinctive

merits of the first, it is destined to supersede every other series already in use. Mr. Veitch's work on the *Irregular and Defective Greek Verbs* is as signal a proof as could be furnished that a book designed to assist the learner or the advanced student may be convenient in size and yet exhaustive in treatment, may be quite original in investigation and yet fall readily into the educational channel, may confine itself to the strictest exposition of phenomena, and yet be fresh with the force of character and lively with the humour that belong more or less to all inquiring and independent minds.

\* \* \* \* \*

"We shall not pretend to review the treatise of an author who stands very nearly, if not altogether, alone in knowledge of his subject. Mr. Veitch is indeed as independent of the praise or the censure of critics as any author need care to be. It is one of his claims to the gratitude of scholars that, in spite of the premature and almost universal desertion of the field of rigid, textual scholarship, for the easier, showier, and pleasanter field of aesthetic or literary disquisition, he has persevered in his forsaken and solitary path, and has produced a work unique of its kind, full of fresh and lasting contributions to our knowledge of the Greek language, and intellectually vivacious and incisive on nearly every page. Open the book anywhere, and instances of erroneous doctrines corrected, of omissions (common to all our lexicons) supplemented, of new theories propounded and vindicated, occur at once. \* \* \* \* Let the critical reader compare Mr. Veitch's treatment of such a compound as *ἀνορθω*, for example, with its handling by other critics, and he will at once see how incomparably more trustworthy Mr. Veitch is as a guide not only for the pupil and teacher, not only for the writer of Greek prose and verse, but also for the constituter of texts and for the advanced amateur scholar. Indeed there is scarcely an authority, whether editor, lexicographer, or grammarian, British or Continental, whom Mr. Veitch has not occasion to correct, modify, or supplement. The German Dindorf, the Dutch Cobet, the French Littré, the English Liddell and Scott, are a few among living scholars who are repeatedly brought to the touchstone of comprehensive induction and acute judgment, while the dicta of departed authorities are canvassed with a freedom which would be almost cruel, were it not uniformly so just. We congratulate Mr. Veitch on the completion, and the Clarendon Press on the publication, of a work which will reinstate our scholarship in that esteem which the Germans have almost ceased to entertain for it since the days of Porson and Elmsley, and which will have the merit not only of purifying the fountain-heads of classical education, but of affording the youthful scholar an example of that moral singleness of purpose and undeviating search for truth which are even rarer than the intellectual gifts that have been lavished on its execution."—*Spectator*.

"The book before us by Mr. William Veitch is quite a wonderful contribution to critical knowledge of Greek, and has been selected by the Delegates of the Clarendon Press to lead off a new series of educational works. Its great distinction, in the first place, is that it is all derived from original reading. Mr. Veitch has not learned

the anatomy of the language from anybody's anatomical plates; he has dissected the body for himself. He has gone with a careful finger through the Greek texts, and the Greek texts in their latest recensions, marking every noticeable form, and checking by his own personal examination the *dicta* of other critics. \* \* \* The book is useful, indeed we may say indispensable, to scholars, in the widest sense of the word. It takes a larger range than its mere title would imply; and besides being a supplement to our best Lexicons, such as that of Liddell and Scott, contains touches of fine philology which would have delighted Porson and Elmsley. Indeed, the perusal of it recalls to our memory the description of Elmsley with which Hermann concluded his review of our countryman's edition of the *Medea*:—‘*Est enim P. Elmsleius, si quis alius, vir natus augendae accuratiori Graecae linguae cognitioni, ut cujus eximia ac plane singularis in pervestigandis rebus grammaticis diligentia regatur praeclaro ingenio, mente ab auctoritatibus libera, animo veri amantissimo, neque aut superbia, aut gloriae studio, aut obtrectandi cupiditate, praepedito.*’ It is a pleasant sign of the increased communication between the northern and southern parts of the United Kingdom that the Clarendon Press should have volunteered to bring this learned treatise before the world; and Mr. Veitch gratefully acknowledges the service in his preface. His book will soon become a text-book in all the great English public schools, and will doubtless by-and-by come to be known and appreciated also in the country in which it was written.”—*Pall Mall Gazette*.

### 3. An Elementary Treatise on Heat, with numerous Woodcuts and Diagrams. By BALFOUR STEWART, LL.D., F.R.S., Director of the Observatory at Kew. (Crown 8vo., cloth, price 7s. 6d.)

“In this work the Author endeavours to place before his readers in an elementary form the facts and principles of the Science of Heat, and also to give some of the most prominent practical applications of our knowledge of this subject. He begins with the study of well-ascertained facts, and proceeds onwards to general principles.

“The work is divided into three parts:—

“1. The study of the various Effects produced on Bodies by Heat. Many of the most recent investigations, and the apparatus used in conducting them, are described at length; and numerical examples are given to help the student to attain to the accuracy needful in physical researches.

“2. The Laws which regulate the Distribution of Heat through Space. This part includes radiation, conduction, convection, and the measurements of specific and latent heat. Theoretic views are here first introduced.

“3. The Nature of Heat, its Sources, and Connexion with other Properties of Matter. In this part heat is viewed as a species of motion; and the leading principles of the Science of Energy, by which heat becomes related to other forms of motion, are discussed.

"The work is chiefly intended for students of Physical Science: but it is hoped that it may also interest general readers by placing before them some of the most remarkable and most practical and valuable truths arrived at by modern researches into the nature and qualities of heat."—*From the Author's Preface.*

#### 4. The Elements of Deductive Logic, designed

mainly for the use of Junior Students in the Universities. By the Rev. T. FOWLER, M.A., Fellow and Tutor of Lincoln College, Oxford. (Crown 8vo., cloth, price 3s. 6d.)

"The precise object of these pages is (without presupposing any technical acquaintance with logical terminology) to enable a student of average intelligence to acquire for himself an elementary knowledge of the main problems, principles, and rules of Deductive Logic."

"The Manuals of Sanderson, Wallis, Aldrich, &c., owing to the peculiar circumstances of the period in which they were written—a period which, being transitional, retained not only much of the scholastic terminology, but also much of the Realistic doctrine—have ceased to be adapted to modern instruction. The Author, with some misgivings, and a keen sense of the difficulties of the task, trusts that the present work may be found usefully to occupy their place. Its propositions cannot however be presented in the same curt and dogmatic shape, for we have learnt to regard many portions of Logic, like many portions of the sciences whose method it claims to analyse, as fairly open to differences of opinion."

"It is hoped that, independently of its bearing on University studies, a short English Manual of Logic may be used with advantage in the Upper Forms of Schools, and that it may not be without interest to the general reader."—*From the Author's Preface.*

#### 5. The Golden Treasury of Ancient Greek

Poetry; being a Collection of the finest passages in the Greek Classic Poets, with Introductory Notices and Notes. By R. S. WRIGHT, M.A., Fellow of Oriel College, Oxford. (Crown 8vo., cloth, price 8s. 6d.)

The arguments in favour of selections from the ancient classics grow stronger as the time lessens which men can devote to the dead languages. Especially in the case of those ancients whose writings are rather of poetical or literary than of historical importance, such as the Greek poets, it seems better that students who cannot work through more than a few thousand lines, should give a part of their labour to detached passages of varied excellence, than that they should spend all their strength on whole works of which many parts are inferior in interest. Not all parts even of the best Greek poems are of equal beauty: the finest pieces are as good occasions for grammatical and critical instruction as those which are less fine; and when the constructive art has been observed in a few whole works, there is much to be said in favour of a wider range and a less continuous but a more

extended and, so far, a more complete survey of the general poetical world of Greece.

Again a collection as well of the less known and accessible gems of Greek poetry as of more familiar passages from the greatest works may be of service to some even of those who no longer read Greek with a view to examinations.

No collection adapted to either of these purposes has yet been published: and the aim of this volume is to supply the want, by bringing together in a convenient form the finest passages of extant Greek verse from the *Iliad* to the later epigrammatists, so far as the limits of about seven thousand lines will allow.

A short statement of the subject of each passage is prefixed wherever such a statement appeared necessary to relieve the obscurity resulting from the absence of context; and in some cases of unusual difficulty an analysis of the connexion of ideas is supplied in the margin. Historical introductions to the several poetical periods, addressed to the origin of each species of poetry and its connexion with the general history of the Greeks, and explanatory notes with occasional translations, are appended.

## 6. Specimens of Early English; being a Series of

Extracts from the most important English Authors, Chronologically arranged, illustrative of the progress of the English Language and its Dialectic varieties, from A.D. 1250 to A.D. 1400. With Grammatical Introduction, Notes, and Glossary. By R. MORRIS, Esq., Editor of "The Story of Genesis and Exodus," &c. (Crown 8vo., cloth, price 7s. 6d) [Nearly ready.]

This work seeks to set before students of the English language a systematic view of its older forms and their development, as exhibited in writers of the latter part of the thirteenth and the whole of the fourteenth centuries: a most important period in the history of our language, though it has been but imperfectly investigated even by the best writers on the subject. Existing text-books on the history of English literature and language not only pass over much that is important in this period, but they also deal in a very unsatisfactory way with many chief authorities, whose style, language, and position are thought to be sufficiently illustrated if twenty or thirty lines are devoted to them. There is in fact no real knowledge of this period to be met with. This present work is intended, partially at least, to fill this blank. It presents a series of specimens selected so as to form a connected and continuous whole. Each passage chosen is of considerable length (the extracts varying from 200 to upwards of 1200 lines); so that the grammar, vocabulary, and manner of each author are completely represented to the student.

These specimens are arranged in chronological order, and illustrate the leading *dialects* of the early English period. They will be found to be (for the most part) new; having been chosen from works which have not usually been quoted and are not well known. In many cases the passages are re-edited from the best MSS.; a few of them now appear for the first time.

The work has a grammatical Introduction, Notes, and a Glossary; and it is hoped that it may be within the reach and capacity of all who take an interest in the *origines* of our mother-tongue. It lays bare some of the strong foundations on which our language is built up; it throws some light on the ethnological and historical characteristics of its period; religion, manners, domestic habits, ranks and orders, of a very important time in the annals of this country are illustrated by it.

It is, however, specially intended for students in colleges in which the English language forms a part of the regular routine of instruction, and for candidates for the Civil and Indian Civil Service.

### In course of Preparation.

#### I. CLASSICS.

1. Sophocles. By the Rev. LEWIS CAMPBELL, M.A.,  
Professor of Greek at St. Andrews, late Fellow of Queen's  
College, Oxford.
2. Homer, Iliad I–XII. By D. B. MONRO, M.A.,  
Fellow of Oriel College, Oxford.
3. Homer, Odyssey I–XII.
4. ——— Odyssey XIII–XXIV. By ROBINSON ELLIS,  
M.A., Fellow of Trinity College, Oxford.
5. A Golden Treasury of Greek Prose, being a col-  
lection of the finest passages in the principal Greek Prose  
Writers, with Introductory Notices and Notes. By R. S.  
WRIGHT, M.A., Fellow of Oriel College, and J. E. L. SHADWELL,  
B.A., Student of Christ Church.
6. Horace. With English Notes and Introduction.  
By the Rev. E. WICKHAM, M.A., Fellow of New College,  
Oxford. Also a small Edition for Schools.
7. Livy I–X. By J. R. SEELEY, M.A., Fellow of  
Christ's College, Cambridge; Professor of Latin, University  
College, London. Also a small edition for Schools.
8. Cicero. Select Letters. By the Rev. A. WATSON,  
M.A., Fellow of Brasenose College, Oxford.
9. Cicero. The Philippic Orations. By the Rev. J. R.  
KING, M.A., Fellow of Merton College, Oxford.

10. Selections from the less known Latin Poets. By the Rev. NORTH PINDER, M.A., late Fellow of Trinity College, Oxford.
11. Selections from Xenophon (adapted for the use of Schools). With English Notes and Maps, by J. S. PHILLPOTTS, B.C.L., Fellow of New College, Oxford; Assistant Master in Rugby School.
12. The Commentaries of C. Jul. Caesar. Part I. The Gallic War, with English Notes, &c., by CHARLES E. MOBERLY, M.A., Assistant Master in Rugby School; late Scholar of Balliol. Also, to follow: Part II. The Civil War: by the same Editor.
13. Select Epistles of Cicero and Pliny (for Schools). With English Notes, by the Rev. C. E. PRICHARD, M.A., late Fellow of Balliol.
14. Selections from Plato (for Schools). With English Notes, by the Rev. B. JOWETT, M.A., Regius Professor of Greek, and J. PURVES, B.A., Balliol College.
15. The Elements of Greek Accentuation (for Schools): abridged from his larger work by H. W. CHANDLER, M.A., Fellow of Pembroke College, Oxford.
16. Cornelius Nepos (for Schools). With English Notes, by OSCAR BROWNING, M.A., Fellow of King's College, Cambridge, and Assistant Master at Eton College.

## II. MENTAL AND MORAL PHILOSOPHY.

1. The Elements of Deductive Logic, designed mainly for the use of Junior Students in the Universities. By the Rev. T. FOWLER, M.A., Fellow and Tutor of Lincoln College, Oxford. (Crown 8vo., cloth, price 3s. 6d.) [Ready.]

## III. MATHEMATICS.

1. An Elementary Treatise on Quaternions. By P. G. TAIT, M.A., Professor of Natural Philosophy in the University of Edinburgh; late Fellow of St. Peter's College, Cambridge. [In the Press.]
2. A Course of Lectures on Pure Geometry. By H. J. STEPHEN SMITH, M.A., F.R.S., Fellow of Balliol College, and Savilian Professor of Geometry in the University of Oxford.

## IV. HISTORY.

1. A History of Germany and of the Empire, down to the close of the Middle Ages. By J. BRYCE, M.A., Fellow of Oriel College, Oxford.
2. A History of British India. By S. OWEN, M.A., Lee's Reader in Law and History, Christ Church; and Reader in Indian Law in the University of Oxford.
3. A History of Greece. By E. A. FREEMAN, M.A., late Fellow of Trinity College, Oxford.
4. A Constitutional History of England. By the Rev. W. STUBBS, M.A., late Fellow of Trinity College, Oxford, and Regius Professor of Modern History.
5. A Church History of the First Three Centuries. By the Rev. W. W. SHIRLEY, D.D., Canon of Christ Church, and Professor of Ecclesiastical History.

## V. LAW.

1. The Institutes of Justinian, with Notes and an English Translation. By J. BRYCE, M.A., Fellow of Oriel College, Oxford.
2. Commentaries on Roman Law; from the original and the best modern sources. In Two Volumes, demy 8vo. By H. J. ROHR, M.A., formerly Fellow of St. John's College, Cambridge; Professor of Law at University College, London.

## VI. PHYSICAL SCIENCE.

1. A Treatise on Natural Philosophy. In four Volumes. By Sir W. THOMSON, LL.D., F.R.S., Professor of Natural Philosophy in the University of Glasgow, and P. G. TAIT, M.A., Professor of Natural Philosophy in the University of Edinburgh; late Fellow of St. Peter's College, Cambridge. Vol. I. nearly ready.
1. Also, by the same Authors, a smaller work on the same subject, forming a complete Introduction to the subject, so far as it can be explained by the help of Elementary Geometry and Algebra. [In the Press.]

3. **Forms of Animal Life.** Illustrated by Descriptions and Drawings of Dissections. By G. ROLLESTON, M.D., F.R.S., Linacre Professor of Physiology, Oxford. [*In the Press.*]
4. **On Laboratory Practice.** By A. VERNON HARCOURT, M.A., Lee's Reader in Chemistry at Christ Church, and H. G. MADAN, M.A., Fellow of Queen's College, Oxford.
5. **Geology.** By J. PHILLIPS, M.A., F.R.S., Professor of Geology, Oxford.
6. **Handbook of Astronomy, Descriptive and Practical.** With very numerous illustrations and tables. By G. F. CHAMBERS, F.R.A.S. [*In the Press.*]

## VII. ENGLISH LANGUAGE AND LITERATURE.

1. **On the Principles of Grammar.** By the Rev. E. THRING, M.A., Head Master of Uppingham School.  
Also, by the same Author, a *Gradual*, designed to serve as an Exercise and Composition Book in the English Language.
2. **The Philology of the English Tongue.** By the Rev. J. EARLE, M.A., late Fellow of Oriel College, Oxford, and late Professor of Anglo-Saxon.
3. **Reading Books.** *The First*, for Junior classes in Schools, in Two Vols. Vol. i. Prose. Vol. ii. Verse.  
*The Second*, for more advanced Readers, in Two Vols. Vol. i. Prose. Vol. ii. Verse. By the Author of "*Mademoiselle Mori*."
4. **Typical Selections from the best English Authors** from the Sixteenth to the Nineteenth Century, (to serve as an higher Reading book,) with Introductory Notices and Notes, being a Contribution towards a History of English Literature.

## VIII. FRENCH.

By MONS. JULES BUÉ,

Honorary M.A. of Oxford; Taylorian Teacher of French, Oxford;  
Examiner in the Oxford Local Examinations from 1858.

1. **A French Grammar.** A complete theory of the French language, with the rules in French and English, and numerous Examples to serve as first Exercises in the language.

2. A French Grammar Test. A book of Exercises on French Grammar; each Exercise being preceded by Grammatical Questions.
3. Exercises in Translation No. 1, from French into English, with general rules on Translation; and containing Notes, Hints, and Cautions, founded on a comparison of the Grammar and Genius of the two languages.
4. Exercises in Translation No. 2, from English into French, on the same plan as the preceding book.
5. Exercises on French Idiomatic Locutions.
6. A new method of French Analysis.
7. Theory of French Pronunciation.

## IX. MISCELLANEOUS.

1. The Principles of Music. By the Rev. Sir F. A. GORE OUSELEY, Bart., M.A., Mus. Doc., Professor of Music, Oxford.
2. A Handbook of Pictorial Art, with numerous Illustrations, and Practical Advice. By the Rev. R. ST. JOHN TYRWHITT, M.A., late Student and Tutor of Christ Church.

## X. ENGLISH CLASSICS.

*Designed to meet the wants of Students in English Literature: under the superintendence of the Rev. J. S. Brewer, M.A., of Queen's College, Oxford, and Professor of English Literature at King's College, London.*

THERE are two dangers to which the student of English literature is exposed at the outset of his task;—his reading is apt to be too narrow or too diffuse.

Out of the vast number of authors set before him in books professing to deal with this subject he knows not which to

select: he thinks he must read a little of all; he soon abandons so hopeless an attempt; he ends by contenting himself with second-hand information; and professing to study English literature, he fails to master a single English author.

On the other hand, by confining his attention to one or two writers, or to one special period of English literature, the student narrows his view of it; he fails to grasp the subject as a whole; and in so doing misses one of the chief objects of his study.

How may these errors be avoided? How may minute reading be combined with comprehensiveness of view?

In the hope of furnishing an answer to these questions the Delegates of the Press, acting upon the advice and experience of Professor Brewer, have determined to issue a series of small volumes, which shall embrace, in a convenient form and at a low price, the general extent of English Literature, as represented in its masterpieces at successive epochs. It is thought that the student, by confining himself, in the first instance, to those authors who are most worthy of his attention, will be saved from the dangers of hasty and indiscriminate reading. By adopting the course thus marked out for him he will become familiar with the productions of the greatest minds in English Literature; and should he never be able to pursue the subject beyond the limits here prescribed, he will have laid the foundation of accurate habits of thought and judgment, which cannot fail of being serviceable to him hereafter.

The authors and works selected are such as will best serve to illustrate English literature in its *historical* aspect. As "the eye of history," without which history cannot be understood, the literature of a nation is the clearest and most intelligible record of its life. Its thoughts and its emotions, its graver and its less serious modes, its pro-

gress, or its degeneracy, are told by its best authors in their best words. This view of the subject will suggest the safest rules for the study of it.

With one exception all writers before the Reformation are excluded from the Series. However great may be the value of literature before that epoch, it is not completely national. For it had no common organ of language; it addressed itself to special classes; it dealt mainly with special subjects. Again; of writers who flourished after the Reformation, who were popular in their day, and reflected the manners and sentiments of their age, the larger part by far must be excluded from our list. Common sense tells us that if young persons, who have but a limited time at their disposal, read Marlowe or Greene, Burton, Hakewill or Du Bartas, Shakspeare, Bacon, and Milton will be comparatively neglected.

Keeping, then, to the best authors in each epoch—and here popular estimation is a safe guide—the student will find the following list of writers amply sufficient for his purpose: Chaucer, Spenser, Hooker, Shakspeare, Bacon, Milton, Dryden, Bunyan, Pope, Johnson, Burke, and Cowper. In other words, Chaucer is the exponent of the Middle Ages in England; Spenser of the Reformation and the Tudors; Hooker of the latter years of Elizabeth; Shakspeare and Bacon of the transition from Tudor to Stuart; Milton of Charles I and the Commonwealth; Dryden and Bunyan of the Restoration; Pope of Anne and the House of Hanover; Johnson, Burke, and Cowper of the reign of George III to the close of the last century.

The list could be easily enlarged; the names of Jeremy Taylor, Clarendon, Hobbes, Locke, Swift, Addison, Goldsmith, and others are omitted. But in so wide a field, the difficulty is to keep the series from becoming unwieldy, without diminishing its comprehensiveness. Hereafter, should

the plan prove to be useful, some of the masterpieces of the authors just mentioned may be added to the list.

The task of selection is not yet finished. For purposes of education, it would neither be possible, nor, if possible, desirable, to place in the hands of students the whole of the works of the authors we have chosen. We must set before them only the masterpieces of literature, and their studies must be directed, not only to the greatest minds, but to their choicest productions. These are to be read again and again, separately and in combination. Their purport, form, language, bearing on the times, must be minutely studied, till the student begins to recognise the full value of each work both in itself and in its relations to those that go before and those that follow it.

It is especially hoped that this Series may prove useful to Ladies' Schools and Middle Class Schools; in which English Literature must always be a leading subject of instruction.

A General Introduction to the Series. By the Rev.  
PROFESSOR BREWER, M.A.

1. Chaucer. The Prologue to the Canterbury Tales; the Knight's Tale; the Nun's Priest's Tale. Edited by R. MORRIS, Esq., Editor for the Early English Text Society, &c. &c.
2. Spenser. Faerie Queene, Book I., with the Poet's letter to Sir Walter Raleigh. Edited by the Rev. G. W. KITCHIN, M.A., formerly Censor of Christ Church.
3. Hooker. Ecclesiastical Polity, Book I. Edited by the Rev. R. W. CHURCH, M.A., Rector of Whatley; formerly Fellow of Oriel College.
4. Shakspeare. The English Historical Plays; the five Great Tragedies; Julius Caesar; and The Tempest. Edited by the Rev. W. G. CLARK, M.A., Fellow of Trinity College, Cambridge, and Public Orator; and J. ALDIS WRIGHT, M.A., Fellow of Trinity College, Cambridge.

5. Bacon. *Essays ; Advancement of Learning*. Edited by J. ALDIS WRIGHT, M.A.
6. Milton. *Allegro and Penseroso ; Comus ; Lycidas ; Paradise Lost ; Samson Agonistes*.
7. Dryden. *Stanzas on the Death of Oliver Cromwell ; Astraea Redux ; Annus Mirabilis ; Absalom and Achitophel ; Religio Laici ; the Hind and Panther*. Edited by the Rev. PROFESSOR BREWER, M.A.
8. Bunyan. *Grace Abounding ; The Pilgrim's Progress*.
9. Pope. *Essay on Man, with the Epistles and Satires*. Edited by the Rev. M. PATTISON, M.A., Rector of Lincoln College, Oxford.
10. Johnson. *Rasselas ; Lives of Pope and Dryden*. Edited by the Rev. J. FRASER, M.A., Rector of Upton-Nervert ; formerly Fellow of Oriel College.
11. Burke. *Thoughts on the Present Discontents ; the two Speeches on America ; Reflections on the French Revolution*, Edited by GOLDWIN SMITH, M.A., Fellow of University College, Oxford ; late Regius Professor of Modern History.
12. Cowper. *The Task, and some of his minor Poems*. Edited by the Rev. T. L. CLAUGHTON, M.A., Vicar of Kidderminster ; formerly Fellow of Trinity College, Oxford, and Professor of Poetry.

The volumes will be (as nearly as possible) uniform in shape and size ; and at the same price. There will be a brief preface, biographical and literary, to each ; and each will have such short notes only as are absolutely needed for the elucidation of the text.

Published for the University of Oxford, by MACMILLAN and CO.,
